If you find information in this manual that is incorrect, misleading, or incomplete, we would appreciate your comments and suggestions.

FCC Warning

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the Instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

CE Mark Warning

This is a Class A product. In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

Energy Saving Note of the Device

This power required device does not support Standby mode operation. For energy saving, please remove the power cable to disconnect the device from the power circuit. In view of saving the energy and reducing the unnecessary power consumption, it is strongly suggested to remove the power connection for the device if this device is not intended to be active.

WEEE Warning

To avoid the potential effects on the environment and human health as a result of the presence of hazardous substances in electrical and electronic equipment, end users of electrical and electronic equipment should understand the meaning of the crossed-out wheeled bin symbol. Do not dispose of WEEE as unsorted municipal waste and have to collect such WEEE separately.

1. INTRODUCTION

Thank you for purchasing PLANET GS-4210 Managed Ethernet Switch series. The descriptions of these models are shown below:

Model	Description
GS-4210-8T2S	8-Port 10/100/1000T + 2-Port 100/1000X SFP Managed Switch
GS-4210-8P2S	8-Port 10/100/1000T 802.3at PoE + 2-Port 100/1000X SFP Managed Switch
GS-4210-8P2C	8-Port 10/100/1000T 802.3at PoE + 2-Port 10/100/1000T +2-Port 100/1000X SFP Managed Switch
GS-4210-16T2S	16-Port Layer 2 Managed Gigabit Ethernet Switch w/2 SFP Interfaces
GS-4210-16P2S	16-Port 10/100/1000T 802.3at PoE + 2-Port 100/1000X SFP Managed Switch
GS-4210-16P4C	16-Port 10/100/1000T 802.3at PoE + 4-Port Gigabit TP/SFP Combo Managed Switch
GS-4210-24P4C	24-Port 10/100/1000T 802.3at PoE + 4-Port Gigabit TP/SFP Combo Managed Switch
GS-4210-24PL4C	24-Port 10/100/1000T 802.3at PoE + 4-Port Gigabit TP/SFP Combo Managed Switch
GS-4210-24T2S	24-Port Layer 2 Managed Gigabit Ethernet Switch w/2 SFP Interfaces
GS-4210-24P2S	24-Port 10/100/1000T 802.3at PoE + 2-Port 100/1000X SFP Managed Switch
GS-4210-24T4S	24-Port 10/100/1000T + 4-Port 100/1000X SFP Managed Gigabit Switch
GS-4210-24T4SR	24-Port 10/100/1000T + 4-Port 100/1000X SFP Managed Gigabit Switch with 36-72V DC Redundant Power
GS-4210-48T4S	48-Port Layer 2 Managed Gigabit Ethernet Switch w/4 SFP Interfaces
GS-4210-48P4S	48-Port 10/100/1000T 802.3at PoE + 4-Port 100/1000BASE-X SFP Managed Switch

“Managed Switch” mentioned in this Guide refers to the models shown above.

1.1 Package Contents

Open the box of the Managed Switch and carefully unpack it. The box should contain the following items:

- ◆ The Managed Switch x 1
- ◆ QR Code Sheet x 1
- ◆ RS232 to RJ45 Cable x 1
- ◆ Rubber Feet x 4
- ◆ Two Rack-mounting Brackets with Attachment Screws x 1
- ◆ Power Cord x 1
- ◆ SFP Dust-proof Cap

	SFP Dust-proof Caps
GS-4210-8P2C GS-4210-8T2S GS-4210-8P2S	2
GS-4210-16T2S GS-4210-16P2S	2
GS-4210-24T2S GS-4210-24P2S	2
GS-4210-16P4C GS-4210-24P4C GS-4210-24PL4C GS-4210-24T4S GS-4210-24T4SR GS-4210-48T4S GS-4210-48P4S	4

If any item is found missing or damaged, please contact your local reseller for replacement.

1.2 Product Description

Cost-optimized Managed Switch for Small and Medium Businesses

PLANET Managed Switch is an ideal Gigabit Switch which provides cost-optimized advantage to local area network and is widely accepted in the SMB office network. It offers **intelligent Layer 2 data packet switching and management functions, friendly web user interface** and **stable operation**. Besides the hot IPv6/IPv4 management and abundant L2/L4 switching functions, the GS-4210 Series comes with fanless feature and green technology to provide a quiet, energy-saving, high-speed and reliable office network environment. The GS-4210-8P2S, GS-4210-8P2C, GS-4210-16P2S, GS-4210-16P4C, GS-4210-24P2Sv3, GS-4210-24P4Cv3, GS-4210-24PL4C and GS-4210-48P4S comply with **IEEE 802.3at Power over Ethernet Plus (PoE+)** at an affordable price. Its **8/16/24/48** Gigabit Ethernet ports are integrated with 802.3at PoE+ injector function on all ports.

The Managed Switch is equipped with **8/16/24/48 10/100/1000BASE-T** Gigabit Ethernet ports and **2/4** additional **100/1000BASE-X** SFP interfaces with inner power system. It offers a rack-mountable, affordable, safe and reliable Gigabit network switch solution for SMBs deploying networks, or requiring enhanced data security and network traffic management.

Cybersecurity Network Solution to Minimize Security Risks

The cybersecurity feature included to protect the switch management in a mission-critical network virtually needs no effort and cost to install. Both SSHv2 and TLSv1.2 protocols are utilized to provide strong protection against advanced threats. The network administrator can now construct highly-secure corporate networks with considerably less time and effort than before.

Redundant Ring, Fast Recovery for Critical Network Applications

The Managed Switch supports redundant ring technology and features strong, rapid self-recovery capability to prevent interruptions and external intrusions. It incorporates advanced **ITU-T G.8032 ERPS (Ethernet Ring Protection Switching)** technology, Spanning Tree Protocol (802.1s MSTP) into customer's network to enhance system reliability and uptime in various environments.

Built-in Unique PoE Functions for Powered Devices Management

As it is the managed PoE switch for surveillance, wireless and VoIP networks, the GS-4210-8P2S, GS-4210-8P2C, GS-4210-16P2S and GS-4210-24P2S feature the following special PoE management functions:

- PD Alive Check
- Scheduled Power Recycling
- PoE Schedule
- PoE Usage Monitoring
- PoE Extension

IPv6/IPv4 Dual Stack Management

Supporting both IPv6 and IPv4 protocols, the Managed Switch helps the SMBs to step in the IPv6 era with the lowest investment as its network facilities need not be replaced or overhauled if the IPv6 FTTx edge network is set up.

Robust Layer 2 Features

The Managed Switch can be programmed for advanced switch management functions such as dynamic port link aggregation, 802.1Q VLAN and **Q-in-Q VLAN**, **Multiple Spanning Tree protocol (MSTP)**, loop and **BPDU guard**, **IGMP snooping**, and **MLD snooping**. Via the link aggregation, the Managed Switch allows the operation of a high-speed trunk to combine with multiple ports, and supports fail-over as well. Also, the **Link Layer Discovery Protocol (LLDP)** is the Layer 2 protocol included to help discover basic information about neighboring devices on the local broadcast domain.

Efficient Traffic Control

The Managed Switch is loaded with robust QoS features and powerful traffic management to enhance services to business-class data, voice, and video solutions. The functionality includes broadcast/multicast **storm control**, per port **bandwidth control**, IP DSCP QoS priority and remarking. It guarantees the best performance for VoIP and video stream transmission, and empowers the enterprises to take full advantage of the limited network resources.

Powerful Security

The Managed Switch offers comprehensive Layer 2 to Layer 4 Access Control List (ACL) for enforcing security to the edge. It can be used to restrict network access by denying packets based on source and destination IP address, TCP/UDP ports or defined typical network applications. Its protection mechanism also comprises 802.1x Port-based user authentication. With the private VLAN function, communication between edge ports can be prevented to ensure user privacy. The network administrators can now construct highly-secure corporate networks with considerably less time and effort than before.

Advanced IP Network Protection

The Managed Switch also provides **DHCP Snooping**, **IP Source Guard** and **Dynamic ARP Inspection** functions to prevent IP snooping from attack and discard ARP packets with invalid MAC address. The network administrator can now build highly-secure corporate networks with considerably less time and effort than before.

Efficient Management

For efficient management, the Managed Switch is equipped with Command line, Web and SNMP management interfaces.

- With the built-in **Web-based** management interface, the Managed Switch offers an easy-to-use, platform-independent management and configuration facility.
- For **text-based** management, it can be accessed via Telnet and the console port.
- By supporting the standard SNMP protocol, the switch can be managed via any SNMP-based management software.

Remote Management Solution

PLANET's **Universal Network Management System** (UNI-NMS) and CloudViewer app support IT staff by remotely managing all network devices and monitoring PDs' operational statuses. Thus, they're designed for both the enterprises and industries where deployments of PDs can be as remote as possible, without having to go to the actual location once a bug or faulty condition is found. With the UNI-NMS or CloudViewer app, all kinds of businesses can now be speedily and efficiently managed from one platform.

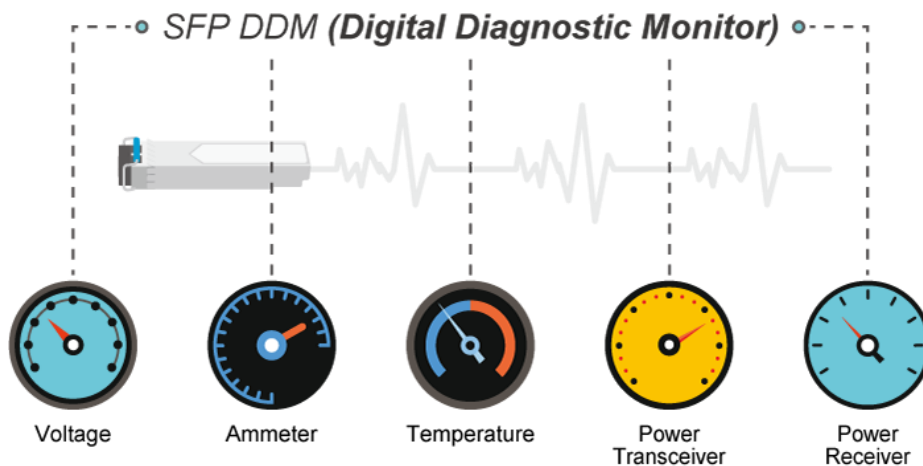

Flexibility and Extension Solution

The 2/4 mini-GBIC slots built in the Managed Switch support SFP auto-detection and dual speed as it features **100BASE-FX** and **1000BASE-SX/LX SFP** (Small Form-factor Pluggable) fiber transceivers to uplink to backbone switch and monitoring center in long distance. The distance can be extended from 550 meters to 2 kilometers (multi-mode fiber) and up to above 10/20/40/60/80/120 kilometers (single-mode fiber or WDM fiber). They are well suited for applications within the enterprise data centers and distributions.

Intelligent SFP Diagnosis Mechanism

The Managed Switch supports **SFP-DDM (Digital Diagnostic Monitor)** function that can easily monitor real-time parameters of the SFP for network administrator, such as optical output power, optical input power, temperature, laser bias current and transceiver supply voltage.

1.3 How to Use This Manual

This User Manual is structured as follows:

Section 2 INSTALLATION

The section explains the functions of the Managed Switch and how to physically install the Managed Switch.

Section 3 SWITCH MANAGEMENT

The section contains the information about the software function of the Managed Switch.

Section 4 WEB CONFIGURATION

The section explains how to manage the Managed Switch by Web interface.

Section 5 COMMAND LINE INTERFACE

The section describes how to use the Command Line interface (CLI).

Section 6 CLI CONFIGURATION

The section explains how to manage the Managed Switch by Command Line interface.

Section 7 SWITCH OPERATION

The chapter explains how to do the switch operation of the Managed Switch.

Section 8 POWER OVER ETHERNET OVERVIEW

The chapter introduces the IEEE 802.3af/802.3at PoE standard and PoE provision of the Managed Switch.

Section 9 TROUBLESHOOTING

The chapter explains how to troubleshoot the Managed Switch.

Appendix A

The section contains cable information of the Managed Switch.

1.4 Product Features

Physical Port

- **8/10/16/24/48 10/100/1000BASE-T** Gigabit RJ45 copper ports
- **2/4 100/1000BASE-X** mini-GBIC/SFP slots
- RJ45 console interface for switch basic management and setup
- Reset button for system factory default and reboot

Switching

- Hardware-based 10/100Mbps, half/full duplex and 1000Mbps full duplex mode, flow control and auto-negotiation and auto MDI/MDI-X
- Features Store-and-Forward mode with wire-speed filtering and forwarding rates
- IEEE 802.3x flow control for full duplex operation and back pressure for half duplex operation
- 9K/10K jumbo frame
- Automatic address learning and address aging
- Supports CSMA/CD protocol

Power over Ethernet (GS-4210 802.3at PoE+ Switch only)

- Complies with IEEE 802.3at Power over Ethernet Plus, end-span PSE
- Backward compatible with IEEE 802.3af Power over Ethernet
- Up to 8/16/24/48 ports of IEEE 802.3af/802.3at devices powered
- Supports PoE power for each PoE port
- Auto detects powered device (PD)
- Circuit protection prevents power interference between ports
- Remote power feeding up to 100 meters in standard mode and 250m in extend mode
- PoE management
 - Per port PoE function enable/disable
 - PoE port power feeding priority
 - Per PoE port power allocation
 - PD classification detection
 - PD alive check
 - PoE schedule

Layer 2 Features

- Prevents packet loss with back pressure (half-duplex) and IEEE 802.3x pause frame flow control (full-duplex)
- High performance Store and Forward architecture, broadcast storm control, runt/CRC filtering eliminates erroneous packets to optimize the network bandwidth
- Supports **VLAN**
 - IEEE 802.1Q tagged VLAN
 - Provider Bridging (VLAN Q-in-Q) support (IEEE 802.1ad)
 - Protocol VLAN
 - Voice VLAN
 - Private VLAN (Protected port)
 - Management VLAN
 - GVRP

■ Supports **Spanning Tree Protocol**

- STP (Spanning Tree Protocol)
- RSTP (Rapid Spanning Tree Protocol)
- MSTP (Multiple Spanning Tree Protocol)
- STP BPDU Guard, BPDU Filtering and BPDU Forwarding

■ Supports **Link Aggregation**

- IEEE 802.3ad Link Aggregation Control Protocol (LACP)
- Cisco ether-channel (static trunk)

■ Provides port mirror (many-to-1)

■ Loop protection to avoid broadcast loops

■ Supports ERPS (Ethernet Ring Protection Switching)

Quality of Service

■ Ingress/Egress Rate Limit per port bandwidth control

■ Storm Control support

- Broadcast/Unknown-Unicast/Unknown-Multicast

■ Traffic classification

- IEEE 802.1p CoS
- TOS/DSCP/IP Precedence of IPv4/IPv6 packets

■ Strict priority and Weighted Round Robin (WRR) CoS policies

Multicast

■ Supports IPv4 IGMP snooping v2 and v3

■ Supports IPv6 MLD snooping v1, v2

■ IGMP querier mode support

■ IGMP snooping port filtering

■ MLD snooping port filtering

Security

■ Authentication

- IEEE 802.1X Port-based network access authentication
- Built-in RADIUS client to co-operate with the RADIUS servers
- RADIUS/TACACS+ login user access authentication

■ Access Control List

- IPv4/IPv6 IP-based ACL/ACE
- MAC-based ACL/ACE

■ MAC Security

- Static MAC
- MAC Filtering

■ Port Security for Source MAC address entries filtering

■ DHCP Snooping to filter distrusted DHCP messages

■ Dynamic ARP Inspection discards ARP packets with invalid MAC address to IP address binding

■ IP Source Guard prevents IP spoofing attacks

■ DoS attack prevention

Management

- IPv4 and IPv6 dual stack management
- Switch Management Interface
 - Web switch management
 - Console/Telnet Command Line Interface
 - SNMP v1 and v2c switch management
 - SSHv2, TLSv1.2 and SNMP v3 secure access
- User Privilege Levels Control
- Built-in Trivial File Transfer Protocol (TFTP) client
- BOOTP and DHCP for IP address assignment
- System Maintenance
 - Firmware upload/download via HTTP/TFTP
 - Configuration upload/download via HTTP/TFTP
 - Dual Images
 - Hardware reset button for system reboot or reset to factory default
- SNTP Network Time Protocol
- Cable Diagnostics
- Link Layer Discovery Protocol (LLDP) Protocol and LLDP-MED
- SNMP trap for interface Link Up and Link Down notification
- Event message logging to remote Syslog server
- Four RMON groups (history, statistics, alarms, and events)
- PLANET Smart Discovery Utility for deployment management
- PLANET NMS system and CloudViewer for deployment management

1.5 Product Specifications

Product	GS-4210-8T2S		GS-4210-8P2S	GS-4210-8P2C
Hardware Specifications				
Hardware Version	1		3	1
Copper Ports	8 x 10/100/1000BASE-T RJ45 Auto-MDI/MDI-X ports	8 x 10/100/1000BASE-T RJ45 Auto-MDI/MDI-X ports	10 x 10/100/1000BASE-T RJ45 Auto-MDI/MDI-X ports	
SFP Ports	2 x 100/1000BASE-X SFP interfaces Supports 100/1000Mbps dual mode and DDM			
PoE Injector Port	NA	8 ports with 802.3at/af PoE injector function with Port-1 to Port-8		
Console	1 x RS-232-to-RJ45 serial port (115200, 8, N, 1)			
Reset Button	< 5 sec: System reboot > 5 sec: Factory default			
Dimensions (W x D x H)	280 x 180 x 44 mm, 1U height			
Weight	1.3 kg		1.6kg	1.7kg
Enclosure	Metal			
Power Requirements	AC 100~240V, 50/60Hz, 2.5A, auto-sensing	AC 100~240V, 50/60Hz, 2.5A, auto-sensing	AC 100~240V, 50/60Hz, 4A, auto-sensing	
Power Consumption/ Dissipation	6.8 watts / 23.2 BTU	170 watts (max.)/580BTU	154 watts (max.)/525BTU	
ESD Protection	Contact Discharge 6KV DC Air Discharge 8KV DC			
Fan	Fanless design	Fanless design	1 fixed speed Fan

Product		GS-4210-16P4C	GS-4210-24P4C	GS-4210-24PL4C
Hardware Specifications				
Hardware Version		3		3
Auto-MDI/MDI-X Copper Ports		20 x 10/100/1000BASE-T RJ45		28 x 10/100/1000BASE-T RJ45
802.3at/af PoE Injector Port		16 ports (Ports 1 to 16)		24 ports (Ports 1 to 24)
100/1000XSFP/mini-GBIC Port		4 ports (Port-17 to 20) Supports DDM		4 ports (Port-25 to 28) Supports DDM
Console		1 x RS-232-to-RJ45 serial port (115200, 8, N, 1)		
Reset Button		< 5 sec: System reboot > 5 sec: Factory default		
Fan		2 fans		3 fans
Dimensions (W x D x H)		441 x 207 x 44 mm, 19-inch, 1U height		441 x 207 x 44 mm, 19-inch, 1U height 440 x 330 x 44 mm, 19-inch, 1U height
Weight		2.8kg		2.9kg 4.6kg
Enclosure		Metal		
Power Requirements		AC 100~240V, 50/60Hz, auto-sensing		
Power Consumption / Dissipation		267 watts (max.)/ 911BTU		333 watts (max.)/ 1136 BTU 505 watts (max.)/ 1723 BTU
LED	System	PWR x 1(Green) SYS x 1 (Green)		
	10/100/1000T RJ45 PoE	1000 LNK/ACT (Green) & 10/100 LNK/ACT x1 (Amber) PoE-in-use x 1 (Amber)		
	10/100/1000T	1000 LNK/ACT (Green) & 10/100 LNK/ACT x 1 (Amber)		
	100/1000X SFP	1000 LNK/ACT (Green)& 100LNK/ACT x1 (Amber)		
Switching Specifications				
Switch Architecture		Store-and-Forward		
Switch Fabric		40Gbps/non-blocking		56Gbps/non-blocking
Switch Throughput@64Bytes		29.76Mpps		41.67Mpps
Address Table		8K entries		
Shared Data Buffer		4.1 megabits		
Flow Control		IEEE 802.3x pause frame for full duplex Back pressure for half duplex		
Jumbo Frame		10K bytes		
Power over Ethernet				
PoE Standard		IEEE 802.3af/802.3at PoE/PSE		

PoE Power Supply Type	End-span		
PoE Power Output	Per Port 54V DC, 300mA. Max. 15.4 watts (IEEE 802.3af) Per Port 54V DC, 600mA. Max. 30 watts (IEEE 802.3at)		
Power Pin Assignment	1/2(+), 3/6(-)		
PoE Power Budget	240 watts (max.)	280 watts (max.)	430 watts (max.)
Number of 802.3af PDs	15 units	18 units	24 units
Number of 802.3at PDs	8 units	9 units	14 units
PoE Management Functions			
PoE Management	PD Alive Check Scheduled Power Recycling PoE Schedule PoE Usage Monitoring PoE Extension		
Active PoE Device Live Detection	Yes		
PoE Power Recycling	Yes, daily or predefined schedule		
PoE Schedule	4 schedule profiles		
PoE Extend Mode	Yes, max. up to 250 meters		
Layer 2 Functions			
Port Mirroring	TX/RX/both Many-to-1 monitor Up to 4 sessions		
VLAN	802.1Q tag-based VLAN Up to 256 VLAN groups, out of 4094 VLAN IDs 802.1ad Q-in-Q tunneling Voice VLAN Protocol VLAN Private VLAN (Protected port) GVRP		
Link Aggregation	IEEE 802.3ad LACP/Static Trunk		
Spanning Tree Protocol	STP, IEEE 802.1D Spanning Tree Protocol RSTP, IEEE 802.1w Rapid Spanning Tree Protocol MSTP, IEEE 802.1s Multiple Spanning Tree Protocol STP BPDU Guard, BPDU Filtering and BPDU Forwarding		
IGMP Snooping	IPv4 IGMP (v2/v3) Snooping IPv4 IGMP Querier Up to 256 multicast groups		
MLD Snooping	IPv6 MLD (v1/v2) Snooping, up to 256 multicast groups		
QoS	8 mapping IDs to 8 level priority queues - Port number - 802.1p priority - DSCP/IP precedence of IPv4/IPv6 packets		

	Traffic classification based, strict priority and WRR Ingress/Egress Rate Limit per port bandwidth control
Ring	Supports ERPS, and complies with ITU-T G.8032 Recovery time < 450ms
Security Functions	
Access Control List	IPv4/IPv6 IP-based ACL/MAC-based ACL IPv4/IPv6 IP-based ACE/MAC-based ACE Max. 256 ACL entries
Port Security	IEEE 802.1X – Port-based authentication Built-in RADIUS client to co-operate with RADIUS server RADIUS/TACACS+ user access authentication
MAC Security	IP-MAC port binding MAC filter Static MAC address, max. 256 static MAC entries
Enhanced Security	DHCP Snooping and DHCP Option82 STP BPDU guard, BPDU filtering and BPDU forwarding DoS attack prevention ARP inspection IP source guard
Management Functions	
Basic Management Interfaces	RS232 to RJ45 Console Web browser Telnet SNMP v1, v2c
Secure Management Interfaces	SSHv2, TLS v1.2, SNMP v3
System Management	Firmware upgrade by HTTP/TFTP protocol through Ethernet network LLDP protocol SNTP PLANET Smart Discovery Utility PLANET NMS System/CloudViewer
Event Management	Remote/Local Syslog System log

2. INSTALLATION

This section describes the hardware features and installation of the Managed Switch on the desktop or rack mount. For easier management and control of the Managed Switch, familiarize yourself with its display indicators, and ports. Front panel illustrations in this chapter display the unit LED indicators. Before connecting any network device to the Managed Switch, please read this chapter completely.

2.1 Hardware Description

2.1.1 Switch Front Panel

The front panel provides a simple interface monitoring the Managed Switch. [Figure 2-1-1](#) to [Figure 2-1-14](#) show the front panels.

■ Gigabit TP Interface

10/100/1000BASE-T Copper, RJ45 twisted-pair: Up to 100 meters.

802.3af/802.3at PoE Injector (**GS-4210-8P2S/GS-4210-8P2C/GS-4210-16P2S/GS-4210-16P4C/GS-4210-24P2Sv3/ GS-4210-24P4Cv3/GS-4210-24PL4C/GS-4210-48P4S**)

■ 100/1000BASE-X SFP Slots

Each of the SFP (Small Form-factor Pluggable) slot supports dual-speed, 1000BASE-SX/LX or 100BASE-FX

- For 1000BASE-SX/LX SFP transceiver module: From 550 meters (multi-mode fiber) to 10/20/40/60/80/120 kilometers (single-mode fiber).
- For 100BASE-FX SFP transceiver module: From 2 kilometers (multi-mode fiber) to 20/40/60 kilometers (single-mode fiber).

■ Console Port

The console port is an RJ45 port connector. It is an interface for connecting a terminal directly. Through the console port, it provides rich diagnostic information including IP Address setting, factory reset, port management, link status and system setting. Users can use the attached DB9 to RJ45 console cable in the package and connect to the console port on the device. After the connection, users can run any terminal emulation program (Hyper Terminal, ProComm Plus, Telix, Winterm and so on) to enter the startup screen of the device.

■ Reset Button

In the middle of the front panel, the reset button is designed for rebooting the Managed Switch without turning off and on the power. The following is the summary table of Reset button function:

Reset Button Pressed and Released	Function
> 5 seconds: Factory Default	Reset the Managed Switch to Factory Default configuration. The Managed Switch will then reboot and load the default.

2.1.2 LED Indications

The front panel LEDs indicate instant statuses of port links, data activity, PoE status and system power. They help monitor and troubleshoot when needed. [Figure 2-1-15](#) to [Figure 2-1-27](#) show their LED indications.

LED Indication

Figure 2-1-15: GS-4210-8T2S LED Panel

■ LED Definition

■ System

LED	Color	Function
PWR	Green	Lights to indicate that the Switch has power.
SYS	Green	Off to indicate the system is booting. Lights to indicate the system is working.

■ 10/100/1000BASE-T Interfaces (Port-1 to Port-8)

LED	Color	Function
LNK/ACT	Green	Lights: To indicate the link through that port is successfully established. Blinks: To indicate that the switch is actively sending or receiving data over that port.

■ 100/1000BASE-X SFP Interfaces (Port-9 to Port-10)

LED	Color	Function
100/1000 LNK/ACT	Green	Lights: To indicate that the port is operating at 100Mbps or 1000Mbps. Blinks: To indicate that the switch is actively sending or receiving data over that port. Off: To indicate that the port is link down .

LED Indication

Figure 2-1-16: GS-4210-8P2S LED Panel

■ LED Definition

■ System

LED	Color	Function
PWR	Green	Lights to indicate that the Switch has power.
SYS	Green	Off to indicate the system is booting. Lights to indicate the system is working.

■ 10/100/1000BASE-T Interfaces (Port-1 to Port-8)

LED	Color	Function
LNK/ACT	Green	Lights: To indicate the link through that port is successfully established. Blinks: To indicate that the switch is actively sending or receiving data over that port.
PoE-In-Use	Amber	Lights: To indicate the port is providing DC in-line power. Off: To indicate the port is not providing DC in-line power.

■ 100/1000BASE-X SFP Interfaces (Port-9 to Port-10)

LED	Color	Function
100/1000 LNK/ACT	Green	Lights: To indicate that the port is operating at 100Mbps or 1000Mbps . Blinks: To indicate that the switch is actively sending or receiving data over that port. Off: To indicate that the port is link down .

LED Indication

■ Per 100/1000Mbps SFP Interface (Port-49 to Port-52)

LED	Color	Function	
LNK/ACT	Green	Lights:	Indicates the link through that port is successfully established at 1000Mbps.
		Blinks:	Indicates that the Switch is actively sending or receiving data over that port.
	Amber	Lights:	Indicates the link through that port is successfully established at 100Mbps.
		Blinks:	Indicates that the Switch is actively sending or receiving data over that port.

LED Indication

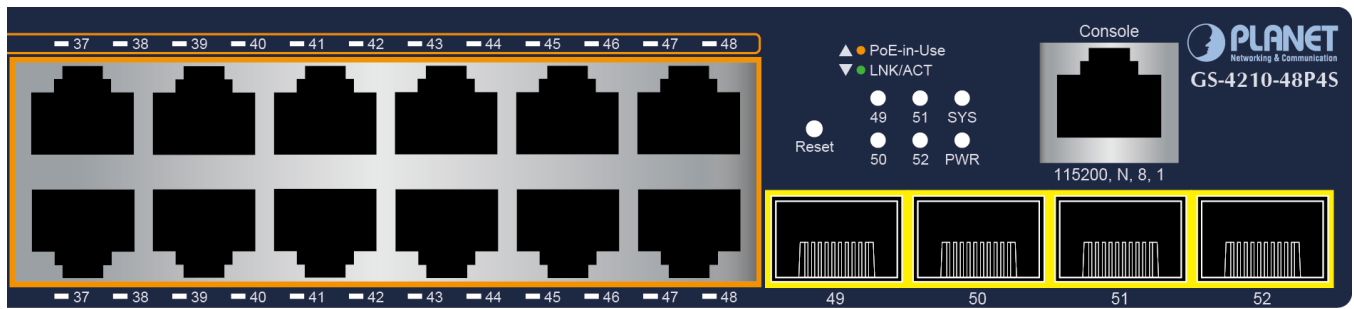

Figure 2-1-27: GS-4210-48P4S LED Panel

■ System

LED	Color	Function
PWR	Green	Lights to indicate that the Switch has power.
SYS	Green	Lights to indicate the system is working.

■ Per 10/100/1000Mbps RJ45 interfaces (Port-1 to Port-48)

LED	Color	Function	
LNK/ACT	Green	Lights:	To indicate the link through that port is successfully established.
		Blinks:	To indicate that the switch is actively sending or receiving data over that port.
PoE	Amber	Lights:	To indicate the port is providing DC in-line power.
		Off:	To indicate the connected device is not a PoE PD.

■ Per 100/1000Mbps SFP Interface (Port-49 to Port-52)

LED	Color	Function	
LNK/ACT	Green	Lights:	Indicates the link through that port is successfully established at 1000Mbps.
		Blink:	Indicates that the Switch is actively sending or receiving data over that port.
	Green	Lights:	Indicates the link through that port is successfully established at 100Mbps.
		Blink:	Indicates that the Switch is actively sending or receiving data over that port.

2.1.3 Switch Rear Panel

The rear panel of the Managed Switch indicates an AC inlet power socket, which accepts input power from 100 to 240V AC, 50-60Hz. [Figure 2-1-28](#) to [Figure 2-1-40](#) show their rear panels.

Rear Panel

Figure 2-1-40: Rear Panel of GS-4210-48P4S

■ AC Power Receptacle

For compatibility with electrical outlet in most areas of the world, the Managed Switch's power supply automatically adjusts to line power in the range of 100-240V AC and 50/60Hz.

Plug the female end of the power cord firmly into the receptacle on the rear panel of the Managed Switch. Plug the other end of the power cord into an electrical outlet and the power will be ready.

Power Notice: The device is a power-required device, which means it will not work till it is powered. If your networks should be active all the time, please consider using UPS (Uninterrupted Power Supply) for your device. It will prevent you from network data loss or network downtime.

Power Notice: In some areas, installing a surge suppression device may also help to protect your Managed Switch from being damaged by unregulated surge or current to the Managed Switch or the power adapter.

2.2 Installing the Switch

This section describes how to install your Managed Switch and make connections to the Managed Switch. Please read the following topics and perform the procedures in the order being presented. To install your Managed Switch on a desktop or shelf, simply complete the following steps.

2.2.1 Desktop Installation

To install the Managed Switch on desktop or shelf, please follow these steps:

Step1: Attach the rubber feet to the recessed areas on the bottom of the Managed Switch.

Step2: Place the Managed Switch on the desktop or the shelf near an AC power source, as shown in Figure 2-1-41.

Figure 2-1-41: Place the Managed Switch on the desktop

Step3: Keep enough ventilation space between the Managed Switch and the surrounding objects.

When choosing a location, please keep in mind the environmental restrictions discussed in Chapter 1, Section 4, and specifications.

Step 4: Connecting the Managed Switch to network devices.

Connect one end of a standard network cable to the 10/100/1000 RJ45 ports on the front of the Managed Switch and the other end of the cable to the network devices such as printer server, workstation or router.

Connection to the Managed Switch requires UTP Category 5 network cabling with RJ45 tips. For more information, please see the Cabling Specification in Appendix A.

Step 5: Supplying power to the Managed Switch.

Connect one end of the power cable to the Managed Switch and the power plug of the power cable to a standard wall outlet. When the Managed Switch receives power, the Power LED should remain solid Green.

2.2.2 Rack Mounting

To install the Managed Switch in a 19-inch standard rack, please follow the instructions described below.

Step1: Place the Managed Switch on a hard flat surface, with the front panel positioned towards the front side.

Step2: Attach the rack-mount bracket to each side of the Managed Switch with supplied screws attached to the package.

Figure 2-1-42 shows how to attach brackets to one side of the Managed Switch.

Figure 2-1-42: Attach Brackets to the Managed Switch

You must use the screws supplied with the mounting brackets. Damage caused to the parts by using incorrect screws would invalidate the warranty.

Step 3: Secure the brackets tightly.

Step 4: Follow the same steps to attach the second bracket to the opposite side.

Step 5: After the brackets are attached to the Managed Switch, use suitable screws to securely attach the brackets to the rack, as shown in Figure 2-1-43.

Figure 2-1-43: Mounting Managed Switch in a Rack

Step 6: Proceed with Steps 4 and 5 of session 2.2.1 Desktop Installation to connect the network cabling and supply power to the Managed Switch.

2.2.3 Installing the SFP transceiver

The sections describe how to insert an SFP transceiver into an SFP slot. The SFP transceivers are hot-pluggable and hot-swappable. You can plug in and out the transceiver to/from any SFP port without having to power down the Managed Switch, as the [Figure 2-1-44](#) shows.

Figure 2-1-44: Plug In the SFP Transceiver

■ Approved PLANET SFP Transceivers

PLANET Managed Switch supports both single mode and multi-mode SFP transceiver. The following list of approved PLANET SFP transceivers is correct at the time of publication:

Gigabit SFP Transceiver Modules

MGB-GT	SFP-Port 1000BASE-T Module
MGB-LX	SFP-Port 1000BASE-LX mini-GBIC module - 20km
MGB-SX	SFP-Port 1000BASE-SX mini-GBIC module - 550m
MGB-SX2	SFP-Port 1000BASE-SX mini-GBIC module - 2km
MGB-L40	SFP-Port 1000BASE-LX mini-GBIC module - 40km
MGB-L80	SFP-Port 1000BASE-LX mini-GBIC module - 80km
MGB-L120	SFP-Port 1000BASE-LX mini-GBIC module - 120km
MGB-LA10	SFP-Port 1000BASE-BX (WDM, TX:1310nm) mini-GBIC module - 10km
MGB-LB10	SFP-Port 1000BASE-BX (WDM, TX:1550nm) mini-GBIC module - 10km
MGB-LA20	SFP-Port 1000BASE-BX (WDM, TX:1310nm) mini-GBIC module - 20km
MGB-LB20	SFP-Port 1000BASE-BX (WDM, TX:1550nm) mini-GBIC module - 20km
MGB-LA40	SFP-Port 1000BASE-BX (WDM, TX:1310nm) mini-GBIC module - 40km
MGB-LB40	SFP-Port 1000BASE-BX (WDM, TX:1550nm) mini-GBIC module - 40km
MGB-LA80	SFP-Port 1000BASE-BX (WDM, TX:1490nm) mini-GBIC module - 80km
MGB-LB80	SFP-Port 1000BASE-BX (WDM, TX:1550nm) mini-GBIC module - 80km

Fast Ethernet SFP Transceiver Modules

MFB-FX	SFP-Port 100BASE-FX Transceiver (1310nm) -2km
MFB-F20	SFP-Port 100BASE-FX Transceiver (1310nm) - 20km
MFB-FA20	SFP-Port 100BASE-BX Transceiver (WDM,TX:1310nm) -20km
MFB-FB20	SFP-Port 100BASE-BX Transceiver (WDM,TX:1550nm) -20km
MFB-F40	SFP-Port 100BASE-FX Transceiver (1310nm) – 40km
MFB-F60	SFP-Port 100BASE-FX Transceiver (1310nm) – 60km

It is recommended to use PLANET SFP on the Managed Switch. If you insert an SFP transceiver that is not supported, the Managed Switch will not recognize it.

In the installation steps below, this Manual uses Gigabit SFP transceiver as an example. However, the steps for Fast Ethernet SFP transceiver are similar.

- Before we connect Managed Switch to the other network device, we have to make sure both sides of the SFP transceivers are with the same media type, for example: 1000BASE-SX to 1000BASE-SX, 1000BASE-LX to 1000BASE-LX.
- Check whether the fiber-optic cable type matches with the SFP transceiver requirement.
 - To connect to 1000BASE-SX SFP transceiver, please use the multi-mode fiber cable with one side being the male duplex LC connector type.
 - To connect to 1000BASE-LX SFP transceiver, please use the single-mode fiber cable with one side being the male duplex LC connector type.

■ Connecting the Fiber Cable

- Insert the duplex LC connector into the SFP transceiver.
- Connect the other end of the cable to a device with SFP transceiver installed.
- Check the LNK/ACT LED of the SFP slot on the front of the Managed Switch. Ensure that the SFP transceiver is operating correctly.
- Check the Link mode of the SFP port if the link fails. To function with some fiber-NICs or Media Converters, user has to set the port Link mode to “**1000 Force**” or “**100 Force**”.

■ Removing the Transceiver Module

1. Make sure there is no network activity anymore.
2. Remove the fiber-optic cable gently.
3. Lift up the lever of the MGB module and turn it to a horizontal position.
4. Pull out the module gently through the lever.

Figure 2-1-45: How to Pull Out the SFP Transceiver

Never pull out the module without lifting up the lever of the module and turning it to a horizontal position. Directly pulling out the module could damage the module and the SFP module slot of the Managed Switch.

3. SWITCH MANAGEMENT

This chapter explains the methods that you can use to configure management access to the Managed Switch. It describes the types of management applications and the communication and management protocols that deliver data between your management device (workstation or personal computer) and the system. It also contains information about port connection options.

This chapter covers the following topics:

- Requirements
- Management Access Overview
- Administration Console Access
- Web Management Access
- SNMP Access
- Standards, Protocols, and Related Reading

3.1 Requirements

- Workstations running Windows XP/2003/2008/2012/Vista/7/8/10/11, MAC OS X or later, Linux, UNIX, or other platforms are compatible with TCP/IP protocols.
- Workstations are installed with Ethernet NIC (Network Interface Card)
- **Serial Port Connection** (Terminal)
 - The above Workstations come with COM Port (DB9) or USB-to-RS-232 converter.
 - The above Workstations have been installed with **terminal emulator**, such as Tera Term, PuTTY or Hyper Terminal included in Windows XP/2003.
 - Serial cable -- one end is attached to the RS-232 serial port, while the other end to the console port of the Managed Switch.
- **Ethernet Port Connection**
 - Network cables -- Use standard network (UTP) cables with RJ45 connectors.
 - The above PC is installed with Web browser.

It is recommended to use Chrome 98.0.xxx or above to access the Managed Switch. If the Web interface of the Managed Switch is not accessible, please turn off the anti-virus software or firewall and then try it again.

3.2 Management Access Overview

The Managed Switch gives you the flexibility to access and manage it using any or all of the following methods:

- An administration **console**
- **Web browser** interface
- An external **SNMP-based network management application**

The administration console and Web browser interface support are embedded in the Managed Switch software and are available for immediate use. Each of these management methods has their own advantages. Table 3-1 compares the three management methods.

Method	Advantages	Disadvantages
Console	<ul style="list-style-type: none"> • No IP address or subnet needed • Text-based • Telnet functionality and HyperTerminal built into Windows 2000/XP, 2003, Vista/7/8/10, 2008 operating systems • Secure 	<ul style="list-style-type: none"> • Must be near the switch or use dial-up connection • Not convenient for remote users • Modem connection may prove to be unreliable or slow
Web Browser	<ul style="list-style-type: none"> • Ideal for configuring the switch remotely • Compatible with all popular browsers • Can be accessed from any location • Most visually appealing 	<ul style="list-style-type: none"> • Security can be compromised (hackers need only know the IP address and subnet mask) • May encounter lag times on poor connections
SNMP Agent	<ul style="list-style-type: none"> • Communicates with switch functions at the MIB level • Based on open standards 	<ul style="list-style-type: none"> • Requires SNMP manager software • Least visually appealing of all three methods • Some settings require calculations • Security can be compromised (hackers need only know the community name)

Table 3-1: Comparison of Management Methods

3.3 Administration Console

The administration console is an internal, character-oriented, and command line user interface for performing system administration such as displaying statistics or changing option settings. Using this method, you can view the administration console from a terminal, personal computer, Apple Macintosh, or workstation connected to the Managed Switch's console port. There are two ways to use this management method: via direct access or modem port access. The following sections describe these methods. For more information about using the console, refer to **Chapter 5 Command Line Interface Console Management**.

Figure 3-1: Console Management

Direct Access

Direct access to the administration console is achieved by directly connecting a terminal or a PC equipped with a terminal-emulation program (such as **HyperTerminal**) to the Managed Switch console (serial) port. When using this management method, a **straight RS-232 to RJ45 cable** is required to connect the switch to the PC. After making this connection, configure the terminal-emulation program to use the following parameters:

The default parameters are:

- 115200 bps
- 8 data bits
- No parity
- 1 stop bit

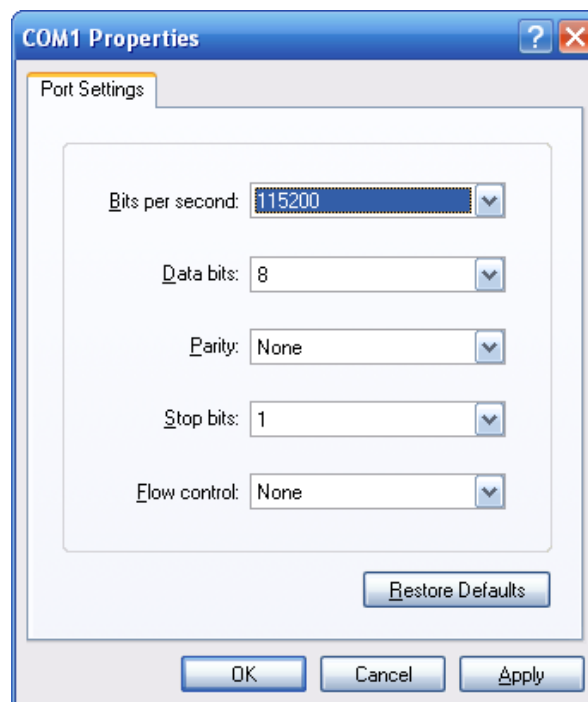

Figure 3-2: Terminal Parameter Settings

You can change these settings, if desired, after you log on. This management method is often preferred because you can remain connected and monitor the system during system reboots. Also, certain error messages are sent to the serial port, regardless of the interface through which the associated action was initiated. A Macintosh or PC attachment can use any terminal-emulation program for connecting to the terminal serial port. A workstation attachment under UNIX can use an emulator such as TIP.

3.3.1 Logging on to the Console

Once the terminal is connected to the device, power on the Managed Switch and the terminal will **run self testing procedures**. Then, the following message asks to log in user name and password. The factory default user name and password are shown as follows and the login screen in [Figure 3-3](#) appears.

1. The following console screen is based on the firmware version before **February of 2024**.
2. The following console screen based on the GS-4210-24T4S is the same as those of the GS-4210 series.

User name: **admin**

Password: **admin**

```
Press any key to continue
Username: admin
Password: *****
GS-4210-24T4S#
```

Figure 3-3: Managed Switch Console Login Screen

The user can now enter commands to manage the Managed Switch. For a detailed description of the commands, please refer to the following chapters.

1. For security reason, **please change and memorize the new password after this first setup**.
2. Only accept command in lowercase letter under console interface.

The following console screen is based on firmware versions released in February 2024 or later.

User name: **admin**

Password: **sw + the last 6 characters of the MAC ID in lowercase**

Find the MAC ID on your device label. The default password is "sw" or "mc" followed by the last six lowercase characters of the MAC ID.

MAC ID: A8F7E0XXXXXX
 Default Password: swxxxxxx
 ("x" means the last 6 digits of the MAC address.
 All characters should be in lowercase.)

Figure 3-4: Managed Switch MAC ID Label

Enter the default username and password, then set a new password according to the rule-based prompt and confirm it. Upon success, press any key to return to the login prompt. Log in with "admin" and the "new password" to access the CLI.

```

GS-4210-24T4S#
```

Figure 3-5: Create a New Password and Login Again

The user can now enter commands to manage the Managed Switch. For a detailed description of the commands, please refer to the following chapters.

3.4 Web Management

The Managed Switch offers management features that allow users to manage the Managed Switch from anywhere on the network through a standard browser such as Microsoft Internet Explorer. After you set up your IP address for the Managed Switch, you can access the Managed Switch's Web interface applications directly in your Web browser by entering the IP address of the Managed Switch.

Figure 3-6: Web Management

You can then use your Web browser to list and manage the Managed Switch configuration parameters from one central location, just as if you were directly connected to the Managed Switch's console port. Web Management requires Google **Chrome**, **Safari** or **Mozilla Firefox** latest version.

The following web screen based on the GS-4210-24P2S is the same as those of other GS-4210 802.3at PoE+ Switch Series.

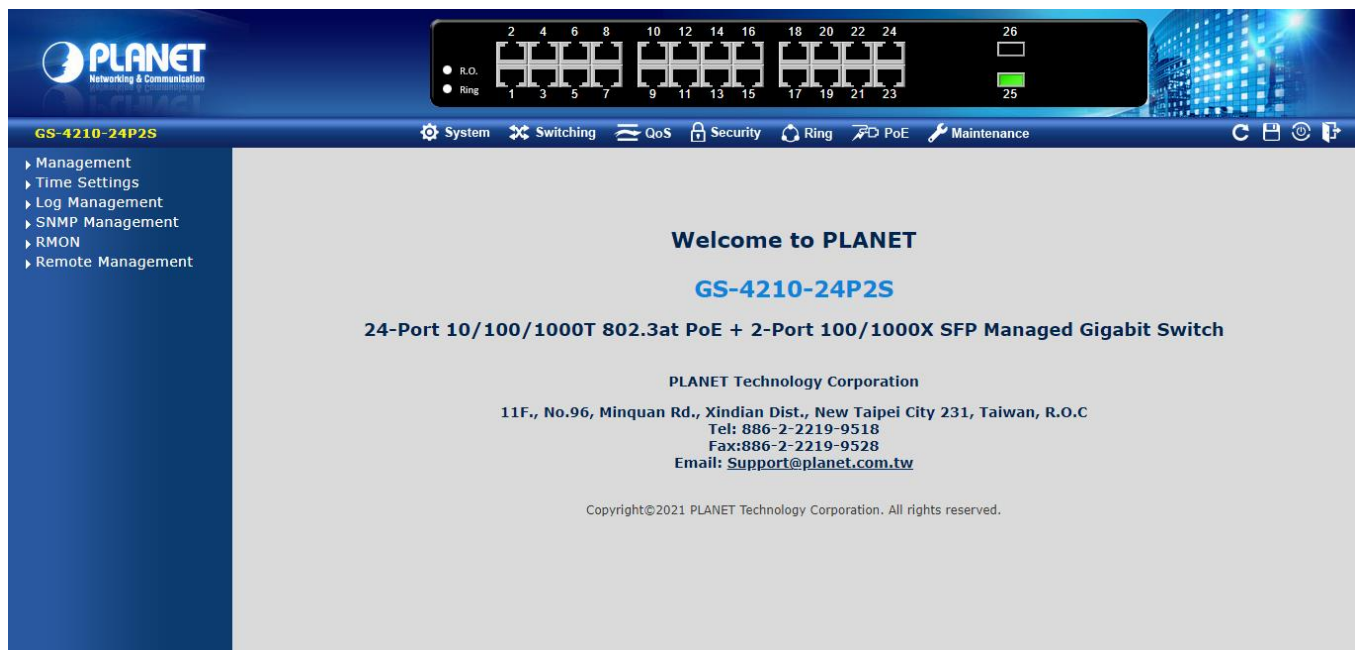

Figure 3-7: Web Main Screen of Managed Switch

3.5 SNMP-based Network Management

You can use an external SNMP-based application to configure and manage the Managed Switch, such as SNMPc Network Manager, HP Openview Network Node Management (NNM) or What's Up Gold. This management method requires the SNMP agent on the switch and the SNMP Network Management Station to use the **same community string**. This management method, in fact, uses two community strings: the **get community** string and the **set community** string. If the SNMP Network management Station only knows the set community string, it can read and write to the MIBs. However, if it only knows the get community string, it can only read MIBs. The default gets and sets community strings for the Managed Switch are public.

Figure 3-8: SNMP Management

For easily listing the Managed Switch in your Ethernet environment, the Planet Smart Discovery Utility is an ideal solution. The following installation instructions are to guide you to running the Planet Smart Discovery Utility.

1. Download the PLANET Smart Discovery Utility from PLANET Official Website.
2. Deposit the Planet Smart Discovery Utility in administrator PC.
3. Run this utility as the following screen appears.

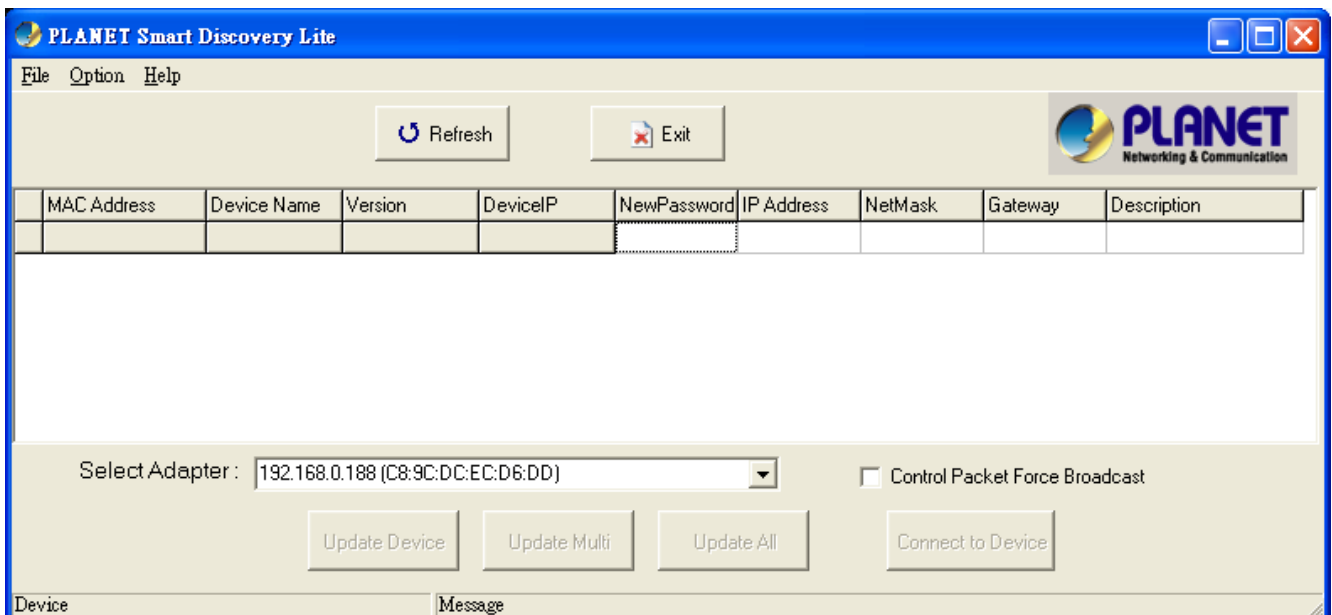

Figure 3-9: Planet Smart Discovery Utility Screen

If there are two LAN cards or above in the same administrator PC, choose a different LAN card by using the **"Select Adapter"** tool.

4. Press **"Refresh"** button for the currently connected devices in the discovery list as the screen shows below:

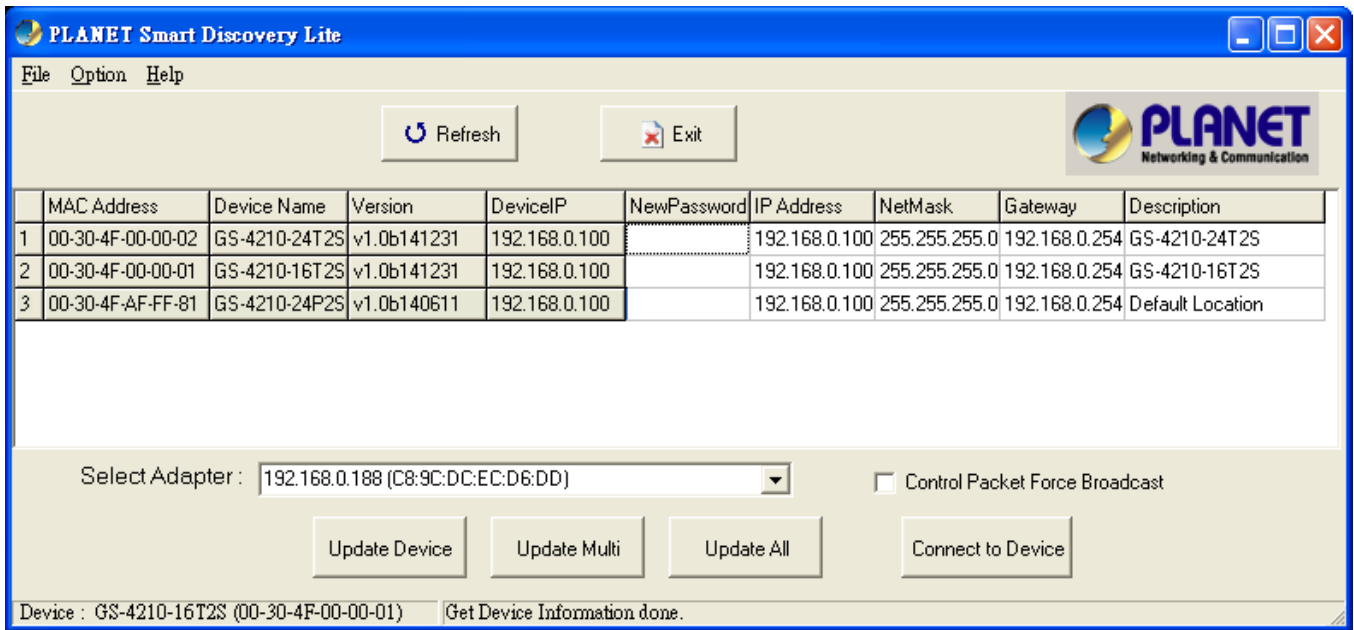

Figure 3-10: Planet Smart Discovery Utility Screen

1. This utility shows all necessary information from the devices, such as MAC Address, Device Name, firmware version and Device IP Subnet address. It can also assign new password, IP Subnet address and description for the devices.
2. After setup is completed, press **"Update Device"**, **"Update Multi"** or **"Update All"** button to take effect. The meaning of the 3 buttons above are shown below:
 - **Update Device:** use current setting on one single device.
 - **Update Multi:** use current setting on choose multi-devices.
 - **Update All:** use current setting on whole devices in the list.

The same functions mentioned above also can be found in **"Option"** tools bar.

3. To click the **"Control Packet Force Broadcast"** function, it allows you to assign a new setting value to the Web Smart Switch under a different IP subnet address.
4. Press **"Connect to Device"** button and the input username/password in web login screen and the web main screen appears in [Figure 3-7](#).
5. Press **"Exit"** button to shut down the Planet Smart Discovery Utility.

4. WEB CONFIGURATION

This section introduces the configuration and functions of the Web-based management.

About Web-based Management

The Managed Switch offers management features that allow users to manage the Managed Switch from anywhere on the network through a standard browser such as Google Chrome.

The Managed Switch can be configured through an Ethernet connection, making sure the manager PC must be set on the same IP subnet address as the Managed Switch.

For example, the default IP address of the Managed Switch is **192.168.0.100**, then the manager PC should be set at **192.168.0.x** (where x is a number between 1 and 254, except 100), and the default subnet mask is 255.255.255.0.

If you have changed the default IP address of the Managed Switch to 192.168.1.1 with subnet mask 255.255.255.0 via console, then the manager PC should be set at 192.168.1.x (where x is a number between 2 and 254) to do the relative configuration on manager PC.

Figure 4-1-1: Web Management

■ Logging on the Managed Switch

1. Use Google Chrome 98.0.xxx or above Web browser. Enter the factory-default IP address to access the Web interface.
The factory-default IP Address as following:

<https://192.168.0.100>

The following web screen is based on the firmware version before **February of 2024**.

- 1: The following web screen based on the GS-4210-24P2S is the same as those of the GS-4210 series
- 2: The PoE function is only available for GS-4210-8P2C, GS-4210-8P2S, GS-4210-16P2S, GS-4210-16P4C, GS-4210-24P2S, GS-4210-24P4C, GS-4210-24PL4C and GS-4210-48P4S.

- When the following dialog box appears, please enter the default user name and password "**admin**". The login screen in [Figure 4-1-2](#) appears.

Default IP address: **192.168.0.100**

Default Username: **admin**

Default Password: **admin**

Figure 4-1-2: Web Login Screen

- After entering the password, the main screen appears as [Figure 4-1-6](#) shows.

The following console screen is based on firmware versions released in February 2024 or later.

- When the following dialog box appears, please enter the default user name "**admin**" and and password. Refer to **Section 3.1** to determine your initial login password.

Default IP Address: **192.168.0.100**

Default User Name: **admin**

Default Password: **sw + the last 6 characters of the MAC ID in lowercase**

- Find the MAC ID on your device label. The default password is "sw" or "mc" followed by the last six lowercase characters of the MAC ID.

MAC ID: A8F7E0XXXXXX
 Default Password: swxxxxxx
 ("x" means the last 6 digits of the MAC address.
 All characters should be in lowercase.)

Figure 4-1-3: Managed Switch MAC ID Label

Figure 4-1-4: Login Screen

6. After logging in, you will be prompted to change the initial password to a permanent one.

Figure 4-1-5: Create a New Password

7. Enter the default username and password, then set a new password according to the rule-based prompt and confirm it. Upon success, press any key to return to the login prompt. Log in with "admin" and the "new password" to access the Web interface.

Figure 4-1-6: Web Main Screen of Managed Switch

- It is recommended to use Google Chrome 98.0.xxx or above to access Managed Switch.
- The changed IP address takes effect immediately after clicking on the **Apply** button. You need to use the new IP address to access the Web interface.

- For security reason, please change and memorize the new password after this first setup.
- Only accept command in lowercase letter under web interface.

4.1 Main Web Page

The Managed Switch provides a Web-based browser interface for configuring and managing it. This interface allows you to access the Managed Switch using the Web browser of your choice. This chapter describes how to use the Managed Switch's Web browser interface to configure and manage it.

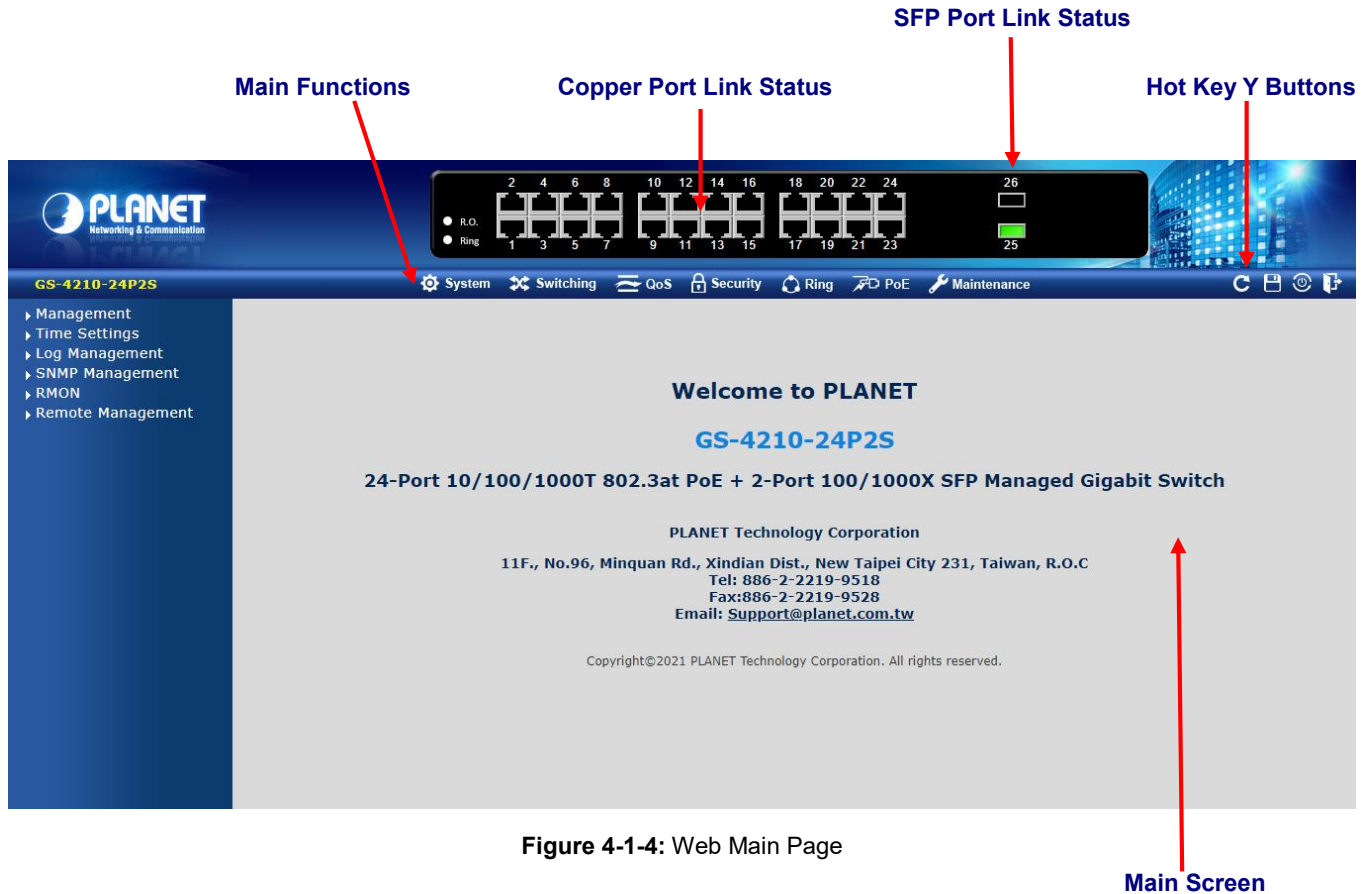

Figure 4-1-4: Web Main Page

Panel Display

The web agent displays an image of the Managed Switch's ports. The Mode can be set to display different information for the ports, including Link up or Link down. Clicking on the image of a port opens the **Port Status** page.

The port states are illustrated as follows:

State	Disabled	Down	Link
RJ45 Ports			
SFP Ports			

Main Menu

Using the onboard Web agent, you can define system parameters, manage and control the Managed Switch, and all its ports, or monitor network conditions. Via the Web-Management, the administrator can set up the Managed Switch by selecting the functions those listed in the Main Function. The screen in [Figure 4-1-5](#) appears.

The Switch Menu on the top of the Web page lets you access all the commands and statistics the Managed Switch provides. The Switch Menu always contains one or more buttons, such as “**System**”, “**Switching**”, “**QoS**”, “**Security**”, “**Ring**”, “**PoE**” and “**Maintenance**”.

Figure 4-1-5: Managed Switch Main Functions Menu

- The PoE function is only available for GS-4210-8P2S, GS-4210-8P2C, GS-4210-16P2S, GS-4210-16P4C, GS-4210-24P2Sv3, GS-4210-24P4Cv3, GS-4210-24PL4C and GS-4210-48P4S.

4.1.1 Saving Configuration via the Web

To save all applied changes and set the current configuration as a startup configuration, the startup-configuration file will be loaded automatically across a system reboot. The screen in [Figure 4-1-6](#) appears.

Figure 4-1-6: Save Configuration Screenshot

1. Click "**Save > Save Configurations to FLASH**" to login to the "Configuration Manager" page.
2. Press the "**Apply**" button to save running configuration to start up configuration.

Configuration Manager	
Save Configuration	
Source File	<input checked="" type="radio"/> Running configuration <input type="radio"/> Startup configuration <input type="radio"/> Backup configuration
Destination File	<input checked="" type="radio"/> Startup configuration <input type="radio"/> Backup configuration
<input type="button" value="Apply"/>	

Figure 4-1-6: Save Configuration Screenshot

4.1.2 Configuration Manager

The system file folder contains configuration settings. The screen in [Figure 4-1-7](#) appears.

Configuration Manager	
Save Configuration	
Source File	<input checked="" type="radio"/> Running configuration <input type="radio"/> Startup configuration <input type="radio"/> Backup configuration
Destination File	<input checked="" type="radio"/> Startup configuration <input type="radio"/> Backup configuration
<input type="button" value="Apply"/>	

Figure 4-1-7: Save Configuration Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Running Configuration 	Refers to the running configuration sequence use in the switch. In switch, the running configuration file stores in the RAM. In the current version, the running configuration sequence running-config can be saved from the RAM to FLASH by saving " Source File = Running Configuration " to " Destination File = Startup Configuration ", so that the running configuration sequence becomes the start up configuration file, which is called configuration save. To prevent illicit file upload and easier configuration, switch mandates the name of running configuration file to be running-config.
<ul style="list-style-type: none"> Startup Configuration 	Refers to the configuration sequence used in switch startup. Startup configuration file stores in nonvolatile storage, corresponding to the so-called configuration save. If the device supports multi-config file, name the configuration file to be .cfg file, the default is startup.cfg. If the device does not support multi-config file, mandates the name of startup configuration file to be startup-config.
<ul style="list-style-type: none"> Backup Configuration 	The backup configuration is empty in FLASH; please save the backup configuration first by " Maintenance > Backup Manager ".

Button

: Click to save configuration.

4.2 System

Use the System menu items to display and configure basic administrative details of the Managed Switch. Under System the following topics are provided to configure and view the system information. This section has the following items:

4.2.1 Management	
■ System Information	The switch system information is provided here.
■ IP Configuration	Configure the switch-managed IP information on this page.
■ IPv6 Configuration	Configure the switch-managed IPv6 information on this page.
■ User Configuration	Configure new user name and password on this page.
4.2.2 Time Settings	
■ System Time	Configure system time settings on this page.
■ SNTP Settings	Configure SNTP settings on this page.
4.2.3 Log Management	
■ Logging Service	Configure logging service settings on this page.
■ Local Logging	Configure local logging settings on this page.

4.2.1 Management

4.2.1.1 System Information

The System Info page provides information for the current device information. System Info page helps a switch administrator to identify the hardware MAC address, software version and system uptime. The screens in [Figure 4-2-1](#) appear.

System Information	
Information Name	Information Value
System Name	Edit GS-4210-24P2S
System Location	Edit Default Location
System Contact	Edit Default Contact
MAC Address	A8:F7:E0:83:82:11
IP Address	10.1.20.54
Subnet Mask	255.255.255.0
Gateway	10.1.20.254
Loader Version	1.0.0.48161
Loader Date	Feb 22 2019 - 15:04:11
Firmware Version	3.305b211007
Firmware Date	Oct 07 2021 - 16:41:44
System Object ID	1.3.6.1.4.1.10456.1.1539
System Up Time	0 days, 4 hours, 42 mins, 57 secs
PCB/HW Version	V3

Figure 4-2-1: System Information Page Screenshot

The page includes the following fields:

Object	Description
• System Name	Display the current system name.
• System Location	Display the current system location.
• System Contact	Display the current system contact.
• MAC Address	The MAC address of this Managed Switch.
• IP Address	The IP address of this Managed Switch.
• Subnet Mask	The subnet mask of this Managed Switch.
• Gateway	The gateway of this Managed Switch.
• Loader Version	The loader version of this Managed Switch.
• Loader Date	The loader date of this Managed Switch.
• Firmware Version	The firmware version of this Managed Switch.
• Firmware Date	The firmware date of this Managed Switch.
• System Object ID	The system objects ID of the Managed Switch.
• System Up Time	The period of time the device has been operational.
• PCB/HW Version	The hardware version of this Managed Switch.
• Smart Fan	The smart fan operation speeds of this Managed Switch.

Buttons

: Click to edit parameter.

4.2.1.2 IP Configuration

The IP Configuration includes the IP Address, Subnet Mask and Gateway. The configured column is used to view or change the IP configuration. Fill out the IP Address, Subnet Mask and Gateway for the device. The screens in [Figure 4-2-2](#) & [Figure 4-2-3](#) appear.

Mode	<input checked="" type="radio"/> Static <input type="radio"/> DHCP
IP Address	192.168.0.100
Subnet Mask	255.255.255.0
Gateway	192.168.0.254
DNS Server 1	168.95.1.1
DNS Server 2	168.95.192.1

Apply

Figure 4-2-2: IP Address Setting Page Screenshot

• Server Port	Display the current SNTP server port.

4.2.3 Log Management

The Managed Switch log management is provided here. The local logs allow you to configure and limit system messages that are logged to flash or RAM memory. The default is for event levels 0 to 3 to be logged to flash and levels 0 to 6 to be logged to RAM. The following table lists the event levels of the Managed Switch:

Level	Severity Name	Description
7	Debug	Debugging messages
6	Informational	Informational messages only
5	Notice	Normal but significant condition, such as cold start
4	Warning	Warning conditions (e.g., return false, unexpected return)
3	Error	Error conditions (e.g., invalid input, default used)
2	Critical	Critical conditions (e.g., memory allocation, or free memory error - resource exhausted)
1	Alert	Immediate action needed
0	Emergency	System unusable

4.2.3.1 Logging Service

The switch system local log information is provided here. The local Log screens in [Figure 4-2-12](#) & [Figure 4-2-13](#) appear.

Figure 4-2-12: Logging Settings Page Screenshot

The page includes the following fields:

Object	Description
• Logging Service	Enabled: Enable logging service operation. Disabled: Disable logging service operation.

Buttons

Apply: Click to apply changes.

Figure 4-2-13: Logging Information Page Screenshot

The page includes the following fields:

Object	Description
• Logging Service	Display the current logging service status.

4.2.3.2 Local Logging

The switch system local logging information is provided here. The local Log screens in [Figure 4-2-14](#) & [Figure 4-2-15](#) appear.

Figure 4-2-14: Local Log Target Setting Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Target 	The target of the local log entry. The following target types are supported: <ul style="list-style-type: none"> ■ Buffered: Target the buffer of the local log. ■ Console: Target the console of the local log. ■ File: Target the file of the local log.
<ul style="list-style-type: none"> • Severity 	The severity of the local log entry. The following severity types are supported: <ul style="list-style-type: none"> ■ Emerg: Emergency level of the system unstable for local log. ■ Alert: Alert level of the immediate action needed for local log. ■ Crit: Critical level of the critical conditions for local log. ■ Error: Error level of the error conditions for local log. ■ Warning: Warning level of the warning conditions for local log. ■ Notice: Notice level of the normal but significant conditions for local log. ■ Info: Informational level of the informational messages for local log. ■ Debug: Debug level of the debugging messages for local log.

Buttons

: Click to apply changes.

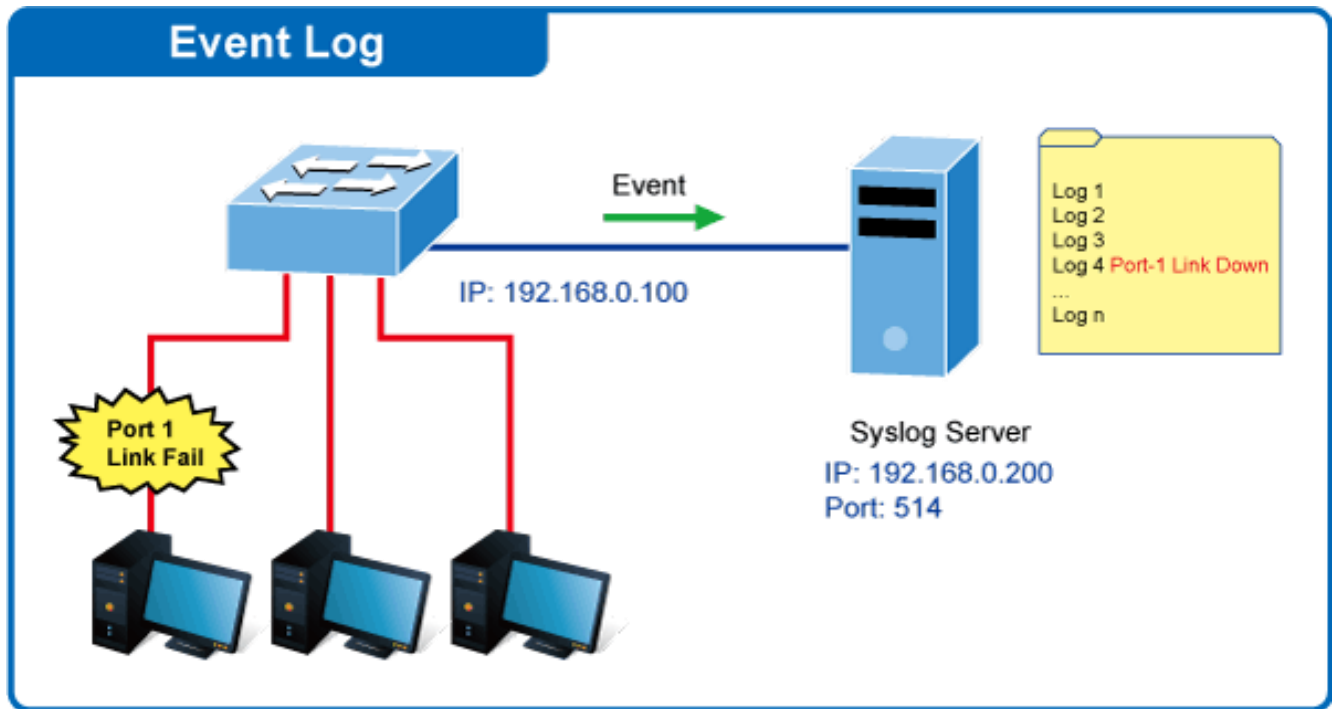

Figure 4-2-15: Local Log Setting Status Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> • Status 	Display the current local log state.
<ul style="list-style-type: none"> • Target 	Display the current local log target.
<ul style="list-style-type: none"> • Severity 	Display the current local log severity.
<ul style="list-style-type: none"> • Action 	 : Delete the current status.

4.2.3.3 Remote Syslog

Configure remote syslog on this page. The Remote Syslog page allows you to configure the logging of messages that are sent to syslog servers or other management stations. You can also limit the event messages sent to only those messages below a specified level.

The Remote Syslog screens in [Figure 4-2-16](#) & [Figure 4-2-17](#) appear.

Remote Logging Setting			
Server Address	Server Port	Severity	Facility
<input type="text"/>	514 (1-65535)	emerg <input type="button" value="v"/>	local0 <input type="button" value="v"/>

Figure 4-2-16: Remote Log Target Page Screenshot

The page includes the following fields:

Object	Description
• Server Address	Provide the remote syslog IP address of this switch.
• Server Port	Provide the port number of remote syslog server. Default Port no.: 514
• Severity	The severity of the local log entry. The following severity types are supported: <ul style="list-style-type: none"> ■ Emerg: Emergency level of the system unstable for local log. ■ Alert: Alert level of the immediate action needed for local log. ■ Crit: Critical level of the critical conditions for local log. ■ Error: Error level of the error conditions for local log. ■ Warning: Warning level of the warning conditions for local log. ■ Notice: Notice level of the normal but significant conditions for local log. ■ Info: Informational level of the informational messages for local log. ■ Debug: Debug level of the debugging messages for local log.

4.2.4 SNMP Management

4.2.4.1 SNMP Overview

The **Simple Network Management Protocol (SNMP)** is an application layer protocol that facilitates the exchange of management information between network devices. It is part of the **Transmission Control Protocol/Internet Protocol (TCP/IP)** protocol suite. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth.

An SNMP-managed network consists of three key components: Network management stations (NMS's), SNMP agents, Management information base (MIB) and network-management protocol:

- **Network management stations (NMS's):** Sometimes called consoles, these devices execute management applications that monitor and control network elements. Physically, NMS's are usually engineering workstation-caliber computers with fast CPUs, megapixel color displays, substantial memory, and abundant disk space. At least one NMS must be present in each managed environment.
- **Agents :** Agents are software modules that reside in network elements. They collect and store management information such as the number of error packets received by a network element.
- **Management information base (MIB) :** A MIB is a collection of managed objects residing in a virtual information store. Collections of related managed objects are defined in specific MIB modules.
- **Network-management protocol :** A management protocol is used to convey management information between agents and NMS's. SNMP is the Internet community's de facto standard management protocol.

SNMP Operations

SNMP itself is a simple request/response protocol. NMS's can send multiple requests without receiving a response.

- **Get --** Allows the NMS to retrieve an object instance from the agent.
- **Set --** Allows the NMS to set values for object instances within an agent.
- **Trap --** Used by the agent to asynchronously inform the NMS of some event. The SNMPv2 trap message is designed to replace the SNMPv1 trap message.

SNMP community

An SNMP community is the group that devices and management stations running SNMP belong to. It helps define where information is sent. The community name is used to identify the group. An SNMP device or agent may belong to more than one SNMP community. It will not respond to requests from management stations that do not belong to one of its communities.

SNMP default communities are:

- **Write** = private
- **Read** = public

4.2.4.2 SNMP Setting

Configure SNMP setting on this page. The SNMP System global setting screens in [Figure 4-2-21](#) & [Figure 4-2-22](#) appear.

The screenshot shows the 'SNMP Global Setting' page. It features a tab labeled 'State' with two radio buttons: 'Disabled' (selected) and 'Enabled'. Below the radio buttons is an 'Apply' button.

Figure 4-2-21: SNMP Global Setting Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Status 	Indicates the SNMP mode operation. Possible modes are: Enabled: Enable SNMP mode operation. Disabled: Disable SNMP mode operation.

Buttons

: Click to apply changes.

The screenshot shows the 'SNMP Informations' section. It contains a table with two columns: 'Information Name' and 'Information Value'. The table has one row with 'SNMP' in the first column and 'Disabled' in the second column.

Figure 4-2-22: SNMP Information Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> SNMP 	Display the current SNMP status.

4.2.4.3 SNMP Community

Configure SNMP Community on this page. The SNMP Community screens in [Figure 4-2-23](#) & [Figure 4-2-24](#) appear.

Figure 4-2-23: Community Setting Page Screenshot

The page includes the following fields:

Object	Description
• Community Name	Indicates the community read/write access string to permit access to SNMP agent. The allowed string length is 0 to 16.
• Community Mode	Indicates the SNMP community supported mode. Possible versions are: <ul style="list-style-type: none"> ■ Basic: Set SNMP community mode supported version 1 and 2c. ■ Advanced: Set SNMP community mode supported version 3.
• Group Name	A string identifying the group name that this entry should belong to. The allowed string length is 1 to 16.
• View Name	A string identifying the view name that this entry should belong to. The allowed string length is 1 to 16.
• Access Right	Indicates the SNMP community type operation. Possible types are: <ul style="list-style-type: none"> RO=Read-Only: Set access string type in read-only mode. RW=Read-Write: Set access string type in read-write mode.

Buttons

Apply: Click to apply changes.

Figure 4-2-24: Community Status Page Screenshot

The page includes the following fields:

Object	Description
• Community Name	Display the current community type.
• Group Name	Display the current SNMP access group's name.
• View Name	Display the current view name.
• Access Right	Display the current access type.
• Delete	Delete : Delete the community entry.

4.2.4.4 SNMP View

Configure SNMPv3 view table on this page. The entry index keys are **View Name** and **OID Subtree**. The SNMPv3 View Table Setting screens in [Figure 4-2-25](#) and [Figure 4-2-26](#) appear.

View Name	Subtree OID	Subtree OID Mask	View Type
<input type="text"/>	<input type="text"/>	all	<input checked="" type="radio"/> included <input type="radio"/> excluded

Add

Figure 4-2-25: SNMPv3 View Table Setting Page Screenshot

The page includes the following fields:

Object	Description
• View Name	A string identifying the view name that this entry should belong to. The allowed string length is 1 to 16.
• Subtree OID	The OID defining the root of the subtree to add to the named view. The allowed string content is digital number or asterisk (*).
• Subtree OID Mask	The bitmask identifies which positions in the specified object identifier are to be regarded as "wildcards" for the purpose of pattern-matching.
• View Type	Indicates the view type that this entry should belong to. Possible view type are: included : An optional flag to indicate that this view subtree should be included. excluded : An optional flag to indicate that this view subtree should be excluded. General, if a view entry's view type is 'excluded', it should exist another view entry in which view type is 'included' and its OID subtree oversteps the 'excluded' view entry.

Buttons

Add: Click to add a new view entry.

The page includes the following fields:

Object	Description
• View Name	Display the current SNMP view name.
• Subtree OID	Display the current SNMP subtree OID.
• OID Mask	Display the current SNMP OID mask.
• View Type	Display the current SNMP view type.
• Action	Delete : Delete the view table entry.

4.2.4.5 SNMP Access Group

Configure SNMPv3 access group on this page. The entry index keys are **Group Name**, **Security Model** and **Security Level**. The SNMPv3 Access Group Setting screens in [Figure 4-2-27](#) & [Figure 4-2-28](#) appear.

Group Name	Security Model	Security Level	Read View Name	Write View Name	Notify View Name
<input type="text"/>	v1	noauth	all	None	None

Add

Figure 4-2-27: SNMPv3 Access Group Setting Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Group Name 	<p>A string identifying the group name that this entry should belong to.</p> <p>The allowed string length is 1 to 16.</p>
<ul style="list-style-type: none"> Security Model 	<p>Indicates the security model that this entry should belong to.</p> <p>Possible security models are:</p> <ul style="list-style-type: none"> v1: Reserved for SNMPv1. v2c: Reserved for SNMPv2c. V3: Reserved for SNMPv3 or User-based Security Model (USM)
<ul style="list-style-type: none"> Security Level 	<p>Indicates the security model that this entry should belong to.</p> <p>Possible security models are:</p> <ul style="list-style-type: none"> Noauth: None authentication and none privacy security levels are assigned to the group. auth: Authentication and none privacy. priv: Authentication and privacy. <p><i>Note: The Security Level applies to SNNPv3 only.</i></p>
<ul style="list-style-type: none"> Read View Name 	<p>Read view name is the name of the view in which you can only view the contents of the agent.</p> <p>The allowed string length is 1 to 16.</p>
<ul style="list-style-type: none"> Write View Name 	<p>Write view name is the name of the view in which you enter data and configure the contents of the agent.</p> <p>The allowed string length is 1 to 16.</p>
<ul style="list-style-type: none"> Notify View Name 	<p>Notify view name is the name of the view in which you specify a notify, inform, or trap.</p>

Buttons

Add : Click to add a new access entry.

Delete : Check to delete the entry.

Figure 4-2-28: SNMP View Table Status Page Screenshot

The page includes the following fields:

Object	Description
• Group Name	Display the current SNMP access group name.
• Security Model	Display the current security model.
• Security Level	Display the current security level.
• Read View Name	Display the current read view name.
• Write View Name	Display the current write view name.
• Notify View Name	Display the current notify view name.
• Action	Delete : Delete the access group entry.

4.2.4.6 SNMP User

Configure SNMPv3 users table on this page. Each SNMPv3 user is defined by a unique name. Users must be configured with a specific security level and assigned to a group. The SNMPv3 group restricts users to a specific read, write, and notify view. The entry index key is **User Name**. The SNMPv3 User Setting screens in [Figure 4-2-29](#) & [Figure 4-2-30](#) appear.

User Name	Group	Privilege Mode	Authentication Protocol	Authentication Password	Encryption Protocol	Encryption Key
<input type="text"/>	<input type="text"/>	<input type="text" value="noauth"/>	<input type="text" value="None"/>	<input type="text" value=""/> (8 ~ 16 chars)	<input type="text" value="None"/>	<input type="text" value=""/> (8 ~ 16 chars)

Add

Figure 4-2-29: SNMPv3 Users Configuration Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> User Name 	<p>A string identifying the user name that this entry should belong to.</p> <p>The allowed string length is 1 to 16.</p>
<ul style="list-style-type: none"> Group 	<p>The SNMP Access Group. A string identifying the group name that this entry should belong to.</p>

<ul style="list-style-type: none"> Authentication Password 	<p>A string identifying the authentication pass phrase. For both MD5 and SHA authentication protocols, the allowed string length is 8 to 16.</p>
<ul style="list-style-type: none"> Encryption Protocol 	<p>Indicates the privacy protocol that this entry should belong to. Possible privacy protocol are:</p> <ul style="list-style-type: none"> ■ None: None privacy protocol. ■ DES: An optional flag to indicate that this user using DES authentication protocol.
<ul style="list-style-type: none"> Encryption Key 	<p>A string identifying the privacy pass phrase.</p> <p>The allowed string length is 8 to 16.</p>

Buttons

Add: Click to add a new user entry.

Figure 4-2-30: SNMPv3 Users Status Page Screenshot

The page includes the following fields:

Object	Description
• User Name	Display the current user name.
• Group	Display the current group.
• Privilege Mode	Display the current privilege mode.
• Authentication Protocol	Display the current authentication protocol.
• Encryption Protocol	Display the current encryption protocol.
• Access Right	Display the current access right.
• Action	<div>Delete</div> : Delete the user entry.

4.2.4.7 SNMPv1, 2 Notification Recipients

Configure SNMPv1 and 2 notification recipients on this page. The SNMPv1, 2 Notification Recipients screens in [Figure 4-2-31](#) & [Figure 4-2-32](#) appear.

Figure 4-2-31: SNMPv1, 2 Notification Recipients Page Screenshot

The page includes the following fields:

Object	Description
• Server Address	Indicates the SNMP trap destination address. It allows a valid IP address in dotted decimal notation ('x.y.z.w'). It can also represent a legally valid IPv4 address. For example, '::192.1.2.34'.
• SNMP Version	Indicates the SNMP trap supported version. Possible versions are: <ul style="list-style-type: none"> ■ SNMP v1: Set SNMP trap supported version 1. ■ SNMP v2c: Set SNMP trap supported version 2c.
• Notify Type	Set the notify type in traps or informs.
• Community Name	Indicates the community access string when send SNMP trap packet.
• UDP Port	Indicates the SNMP trap destination port. SNMP Agent will send SNMP message via this port, the port range is 1~65535.
• Time Out	Indicates the SNMP trap inform timeout. The allowed range is 1 to 300 .
• Retries	Indicates the SNMP trap inform retry times. The allowed range is 1 to 255 .

Buttons

Add : Click to add a new SNMPv1, 2 host entry.

Figure 4-2-32: SNMPv1, 2 Host Status Page Screenshot

The page includes the following fields:

Object	Description
• Server Address	Display the current server address.
• SNMP Version	Display the current SNMP version.
• Notify Type	Display the current notify type.
• Community Name	Display the current community name.
• UDP Port	Display the current UDP port.
• Time Out	Display the current time out.
• Retries	Display the current retry times.
• Action	<div>Delete</div> : Delete the SNMPv1, 2 host entry.

4.2.4.8 SNMPv3 Notification Recipients

Configure SNMPv3 notification recipients on this page. The SNMPv1, 2 Notification Recipients screens in [Figure 4-2-33](#) & [Figure 4-2-34](#) appear.

Server Address	Notify Type	User Name	UDP Port	TimeOut	Retries
	Traps		162 (1-65535)	15 (1-300)	3 (1-255)

Add

Figure 4-2-33: SNMPv3 Notification Recipients Page Screenshot

The page includes the following fields:

Object	Description
• Server Address	Indicates the SNMP trap destination address. It allows a valid IP address in dotted decimal notation ('x.y.z.w'). It can also represent a legally valid IPv4 address. For example, '::192.1.2.34'.
• Notify Type	Set the notify type in traps or informs.
• User Name	Indicates the user string when send SNMP trap packet.
• UDP Port	Indicates the SNMP trap destination port. SNMP Agent will send SNMP message via this port, the port range is 1~65535.
• Time Out	Indicates the SNMP trap inform timeout. The allowed range is 1 to 300 .
• Retries	Indicates the SNMP trap inform retry times. The allowed range is 1 to 255 .

Buttons

Add: Click to add a new SNMPv3 host entry.

Server Address	Notify Type	User Name	UDP Port	Time Out	Retry	Action
----------------	-------------	-----------	----------	----------	-------	--------

The page includes the following fields:

Object	Description
• Server Address	Display the current server address.
• Notify Type	Display the current notify type.
• User Name	Display the current user name.
• UDP Port	Display the current UDP port.
• Time Out	Display the current time out.
• Retries	Display the current retry times.
• Action	<div>Delete</div> : Delete the SNMPv3 host entry.

4.2.4.9 SNMP Engine ID

Configure SNMPv3 Engine ID on this page. The entry index key is Engine ID. The remote engine ID is used to compute the security digest for authenticating and encrypting packets sent to a user on the remote host. The SNMPv3 Engine ID Setting screens in [Figure 4-2-35](#) & [Figure 4-2-36](#) appear.

Figure 4-2-35: SNMPv3 Engine ID Setting Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Engine ID 	An octet string identifying the engine ID that this entry should belong to. The string must contain an even number between 10 and 64 hexadecimal digits, but all-zeros and all-'F's are not allowed.

Buttons

: Click to apply changes.

• Remote IP Address	Display the current remote IP address.
• Engine ID	Display the current engine ID.
• Action	<input type="button" value="Delete"/> : Delete the remote IP address entry.

4.2.5 RMON

4.2.5.1 RMON Overview

RMON is the most important expansion of the standard SNMP. RMON is a set of MIB definitions, used to define standard network monitor functions and interfaces, enabling the communication between SNMP management terminals and remote monitors. RMON provides a highly efficient method to monitor actions inside the subnets.

MID of RMON consists of 10 groups. The switch supports the most frequently used group 1, 2, 3 and 9:

- **Statistics:** Maintain basic usage and error statistics for each subnet monitored by the Agent.
- **History:** Record periodical statistic samples available from Statistics.
- **Alarm:** Allow management console users to set any count or integer for sample intervals and alert thresholds for RMON Agent records.
- **Event:** A list of all events generated by RMON Agent.

Alarm depends on the implementation of Event. Statistics and History display some current or history subnet statistics. Alarm and Event provide a method to monitor any integer data change in the network, and provide some alerts upon abnormal events (sending Trap or record in logs).

4.2.5.2 RMON Statistics

This page provides a Detail of a specific RMON statistics entry; RMON Statistics screen in [Figure 4-2-39](#) appears.

Port GE1 RMON Statistics	
Port GE1 Clear	
RMON Counters	Value
Drop Events	0
Octets	5192377
Packets	36210
Broadcast Packets	508
Multicast Packets	156
CRC / Alignment Errors	0
Undersize Packets	0
Oversize Packets	0
Fragments	0
Jabbers	0
Collisions	0
64 Bytes Frame	23107
65-127 Byte Frames	5685
128-255 Byte Frames	227
256-511 Byte Frames	7161
512-1023 Byte Frames	30
1024-1518 Byte Frames	0

Figure 4-2-39: RMON Statistics Detail Page Screenshot

The Page includes the following fields:

Object	Description
• Port	Select port for this drop down list.
• Drop Events	The total number of events in which packets were dropped by the probe due to lack of resources.
• Octets	The total number of octets of data (including those in bad packets) received on the network.
• Packets	The total number of packets (including bad packets, broadcast packets, and multicast packets) received.
• Broadcast Packets	The total number of good packets received that were directed to the broadcast address.
• Multicast Packets	The total number of good packets received that were directed to a multicast address.
• CRC/Alignment Errors	The total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets.
• Undersize Packets	The total number of packets received that were less than 64 octets.
• Oversize Packets	The total number of packets received that were longer than 1518 octets.
• Fragments	The number of frames which size is less than 64 octets received with invalid CRC.
• Jabbers	The number of frames which size is larger than 64 octets received with invalid CRC.
• Collisions	The best estimate of the total number of collisions on this Ethernet segment.
• 64 Bytes Frame	The total number of packets (including bad packets) received that were 64 octets in length.
• 65~127 Byte Frames	The total number of packets (including bad packets) received that were between 65 to 127 octets in length.
• 128~255 Byte Frames	The total number of packets (including bad packets) received that were between 128 to 255 octets in length.
• 256~511 Byte Frames	The total number of packets (including bad packets) received that were between 256 to 511 octets in length.
• 512~1023 Byte Frames	The total number of packets (including bad packets) received that were between 512 to 1023 octets in length.
• 1024~1518 Byte Frames	The total number of packets (including bad packets) received that were between 1024 to 1518 octets in length.

Buttons

: Click to clear the RMON statistics

4.2.5.3 RMON Event

Configure RMON Event table on this page. The RMON Event screens in [Figure 4-2-40](#) & [Figure 4-2-41](#) appear.

Figure 4-2-40: RMON Event Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Select Index	Select index for this drop down list to create new index or modify index.
• Index	Indicates the index of the entry. The range is from 1 to 65535.
• Type	Indicates the notification of the event, the possible types are: <ul style="list-style-type: none"> ■ None: The total number of octets received on the interface, including framing characters. ■ Log: The number of uni-cast packets delivered to a higher-layer protocol. ■ SNMP-Trap: The number of broad-cast and multi-cast packets delivered to a higher-layer protocol. ■ Log and Trap: The number of inbound packets that are discarded even the packets are normal.
• Community	Specify the community when trap is sent, the string length is from 0 to 127, default is "public".
• Owner	Indicates the owner of this event, the string length is from 0 to 127, default is a null string.
• Description	Indicates description of this event, the string length is from 0 to 127, default is a null string.

Buttons

: Click to apply changes.

Figure 4-2-41: RMON Event Status Page Screenshot

The page includes the following fields:

Object	Description
• Index	Display the current event index.
• Event Type	Display the current event type.
• Community	Display the current community for SNMP trap.
• Description	Display the current event description.
• Last Sent Time	Display the current last sent time.
• Owner	Display the current event owner.
• Action	Click  to delete RMON event entry.

4.2.5.4 RMON Event Log

This page provides an overview of RMON Event Log. The RMON Event Log Table screen in [Figure 4-2-42](#) appears.

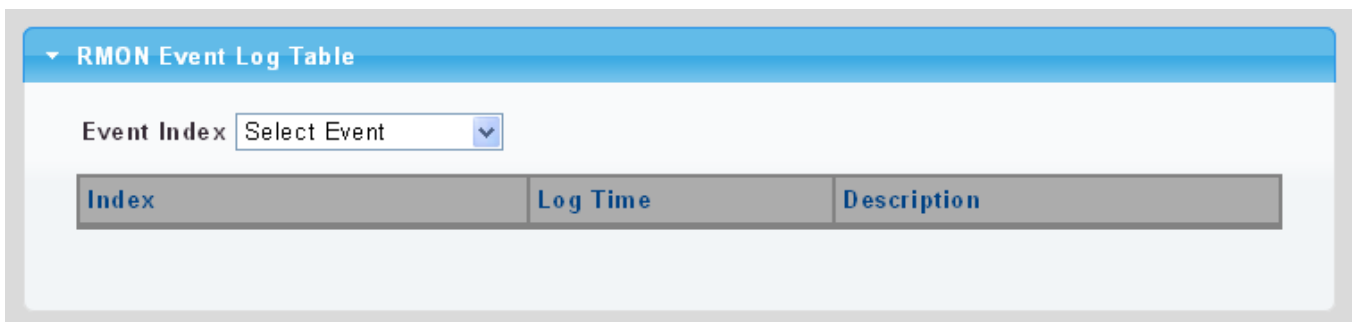

Figure 4-2-42: RMON Event Log Table Page Screenshot

The page includes the following fields:

Object	Description
• Select Index	Select index for this drop down list.
• Index	Indicates the index of the log entry.
• Log Time	Indicates Event log time.
• Description	Indicates the Event description.

4.2.5.5 RMON Alarm

Configure RMON Alarm table on this page. The RMON Alarm screens in [Figure 4-2-43](#) & [Figure 4-2-44](#) appear.

RMON Alarm

Select Index	Create New
Index	0 (1-65535)
Sample Port	GE1
Sample Variable	DropEvents
Sample Interval	0 (1-2147483647)
Sample Type	<input type="radio"/> absolute <input type="radio"/> delta
Rising Threshold	0 (0-2147483647)
Falling Threshold	0 (0-2147483647)
Rising Event	0: None (Unassigned)
Falling Event	0: None (Unassigned)
Owner	(0~31 Characters)

Apply

Figure 4-2-43: RMON Alarm Table Page Screenshot

The page includes the following fields:

Object	Description
• Select Index	Select index for this drop down list to create the new index or modify the index.
• Index	Indicates the index of the alarm entry.
• Sample Port	Select port for this drop down list.
• Sample Variable	<p>Indicates the particular variable to be sampled, the possible variables are:</p> <ul style="list-style-type: none"> ■ DropEvents: The total number of events in which packets were dropped due to lack of resources. ■ Octets: The number of received and transmitted (good and bad) bytes. Includes FCS, but excludes framing bits. ■ Pkts: The total number of frames (bad, broadcast and multicast) received and transmitted. ■ BroadcastPkts: The total number of good frames received that were directed to the broadcast address. Note that this does not include multicast packets. ■ MulticastPkts: The total number of good frames received that were directed to this multicast address.

	<ul style="list-style-type: none"> ■ CRCAlignErrors: The number of CRC/alignment errors (FCS or alignment errors). ■ UnderSizePkts: The total number of frames received that were less than 64 octets long(excluding framing bits, but including FCS octets) and were otherwise well formed. ■ OverSizePkts: The total number of frames received that were longer than 1518 octets(excluding framing bits, but including FCS octets) and were otherwise well formed. ■ Fragments: The total number of frames received that were less than 64 octets in length (excluding framing bits, but including FCS octets) and had either an FCS or alignment error. ■ Jabbers: The total number of frames received that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS or alignment error. ■ Collisions: The best estimate of the total number of collisions on this Ethernet segment. ■ Pkts64Octets: The total number of frames (including bad packets) received and transmitted that were 64 octets in length (excluding framing bits but including FCS octets). ■ Pkts64to172Octets: The total number of frames (including bad packets) received and transmitted where the number of octets falls within the specified range (excluding framing bits but including FCS octets). ■ Pkts158to255Octets: The total number of frames (including bad packets) received and transmitted where the number of octets falls within the specified range (excluding framing bits but including FCS octets). ■ Pkts256to511Octets: The total number of frames (including bad packets) received and transmitted where the number of octets falls within the specified range (excluding framing bits but including FCS octets). ■ Pkts512to1023Octets: The total number of frames (including bad packets) received and transmitted where the number of octets falls within the specified range (excluding framing bits but including FCS octets). ■ Pkts1024to1518Octets: The total number of frames (including bad packets) received and transmitted where the number of octets falls within the specified range (excluding framing bits but including FCS octets).
• Sample Interval	Sample interval (1–2147483647).
• Sample Type	<p>The method of sampling the selected variable and calculating the value to be compared against the thresholds, possible sample types are:</p> <ul style="list-style-type: none"> ■ Absolute: Get the sample directly (default). ■ Delta: Calculate the difference between samples.

• Rising Threshold	Rising threshold value (0–2147483647).
• Falling Threshold	Falling threshold value (0–2147483647).
• Rising Event	Event to fire when the rising threshold is crossed.
• Falling Event	Event to fire when the falling threshold is crossed.
• Owner	Specify an owner for the alarm.

Buttons**Apply**

: Click to apply changes.

**Figure 4-2-44:** RMON Alarm Status Page Screenshot

The page includes the following fields:

Object	Description
• Index	Indicates the index of Alarm control entry.
• Sample Port	Display the current sample port.
• Sample Variable	Display the current sample variable.
• Sample Interval	Display the current interval.
• Sample Type	Display the current sample type.
• Rising Threshold	Display the current rising threshold.
• Falling Threshold	Display the current falling threshold.
• Rising Event	Display the current rising event.
• Falling Event	Display the current falling event.
• Owner	Display the current owner.
• Action	Click Delete to delete RMON alarm entry.

4.2.5.6 RMON History

Configure RMON History table on this page. The RMON History screens in [Figure 4-2-45](#) & [Figure 4-2-46](#) appear.

RMON History	
Select Index	Create New
Index	0 (1-65535)
Sample Port	GE1
Bucket Requested	50 (1-50, Default 50)
Interval	1800 (1-3600 Default 1800)
Owner	(0~31 Characters)

Apply

Figure 4-2-45: RMON History Table Page Screenshot

The page includes the following fields:

Object	Description
• Select Index	Select index for this drop down list to create the new index or modify the index.
• Index	Indicates the index of the history entry.
• Sample Port	Select port for this drop down list.
• Bucket Requested	Indicates the maximum data entries associated this History control entry stored in RMON. The range is from 1 to 50, default value is 50.
• Interval	Indicates the interval in seconds for sampling the history statistics data. The range is from 1 to 3600, default value is 1800 seconds.
• Owner	Specify an owner for the history.

Buttons

Apply: Click to apply changes.

Rmon History					
Index	Data Source	Bucket Requested	Interval	Owner	Action
					Delete

The page includes the following fields:

Object	Description
• History Index	Select history index for this drop down list.

Buttons

: Click to apply changes

4.2.6 Remote Management

The Managed Switch can support both NMS controller and CloudViewer Server for remote management. PLANET's **NMS Controller** is a Network Management System can monitor all kinds of deployed network devices, such as managed switches, media converters, routers, smart APs, VoIP phones, IP cameras, etc., compliant with the SNMP Protocol, ONVIF Protocol and PLANET Smart Discovery utility. The **CloudViewer** is a free networking service just for PLANET Products. This service provides simplified network monitoring and real-time network status. Working with PLANET CloudViewer app, user can easily check network status, device information, Port and PoE status from Internet. Any other services are not included.

The Remote NMS Configuration screens in [Figure 4-2-48](#) appear.

Figure 4-2-48: Remote NMS Configuration Page Screenshot

The NMS Controller – LAN Configuration screens in [Figure 4-2-49](#) appear.

• Remote NMS Enable	Enable NMS management.
• Subscriber email	The email registered on CloudViewer Server.
• Password	The password of your CloudViewer account.
• Status	Indicate the status of connecting CloudViewer Server.

4.3 Switching

Use the Switching menu items to display and configure management functions of the Managed Switch. This section has the following items:

4.3.1 Port Management	
■ Port Configuration	Configures port configuration settings.
■ Port Counters	Lists Ethernet and RMON port statistics.
■ Bandwidth Utilization	Displays current bandwidth utilization.
■ Port Mirroring	Sets the source and target ports for mirroring.
■ Jumbo Frame	Sets the jumbo frame on the switch.
■ Port Error Disable Configuration	Configures port error disable settings.
■ Port Error Disabled Status	Disables port error status.
■ Protected Port	Configures protected ports settings.
■ EEE	Configures EEE settings.
4.3.2 Link Aggregation	
■ LAG Setting	Configures load balance algorithm configuration settings.
■ LAG Management	Configures LAG configuration settings.
■ LAG Port Setting	Configures LAG port settings.
■ LACP Setting	Configures LACP priority settings.
■ LACP Port Setting	Configure LACP configuration settings.
■ LAG Status	Display LAG status / LACP information.
4.3.3 VLAN	
■ Management VLAN	Configures the management VLAN.
■ Create VLAN	Creates the VLAN group.
■ Interface Settings	Configures mode and PVID on the VLAN port.
■ Port to VLAN	Configures the VLAN membership.
■ Port VLAN Membership	Display the VLAN membership.
■ Protocol VLAN Group Setting	Configures the protocol VLAN group.
■ Protocol VLAN Port Setting	Configures the protocol VLAN port setting.
■ GVRP Setting	Configures GVRP global setting.
■ GVRP Port Setting	Configures GVRP port setting.
■ GVRP VLAN	Display the GVRP VLAN database.
■ GVRP Statistics	Display the GVRP port statistics.
4.3.4 Spanning Tree	
■ STP Global Setting	Configures STP system settings.
■ STP Port Setting	Configuration per port STP setting.
■ CIST Instance Setting	Configure system configuration.
■ CIST Port Setting	Configure CIST port setting.
■ MST Instance Setting	Configuration each MST instance setting.
■ MST Port Setting	Configuration per port MST setting.

■ STP Statistics	Display the STP statistics.
4.3.5 Multicast	
■ Properties	Configures multicast properties.
■ Multicast Throttling Setting	Configures multicast throttling setting.
■ Multicast Profile Setting	Configures multicast profile setting.
4.3.6 IGMP Snooping	
■ IGMP Setting	Configure IGMP settings on this page.
■ IGMP Querier Setting	Configure IGMP querier settings on this page.
■ IGMP Static Group	Configure IGMP static group settings on this page.
■ IGMP Group Table	Configure IGMP group table settings on this page.
■ IGMP Router Setting	Configure IGMP router settings on this page.
■ IGMP Router Table	Provide IGMP router table statistics on this page.
■ IGMP Forward All	Configure IGMP forward all settings on this page.
■ IGMP Snooping Statistics	Provide IGMP snooping statistics on this page.
■ IGMP Filter Setting	Configure IGMP filter settings on this page.
4.3.7 MLD Snooping	
■ MLD Setting	Configure MLD settings on this page.
■ MLD Static Group	Configure MLD static group settings on this page.
■ MLD Group Table	Configure MLD group table settings on this page.
■ MLD Router Setting	Configure MLD router settings on this page.
■ MLD Router Table	Provide MLD router table statistics on this page.

4.3.1 Port Management

Use the Port Menu to display or configure the Managed Switch's ports.

4.3.1.1 Port Configuration

This page displays current port configurations and status. Ports can also be configured here. The table has one row for each port on the selected switch in a number of columns, which are:

The Port Configuration screens in [Figure 4-3-1](#) & [Figure 4-3-2](#) appear.

Port Select	Enabled	Speed	Duplex	Flow Control
Select Ports ▼	<input checked="" type="radio"/> Enable <input type="radio"/> Disable	Auto ▼	Auto ▼	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Fiber Ports ▼	<input checked="" type="radio"/> Enable <input type="radio"/> Disable	Auto-1000M ▼	Auto ▼	<input type="radio"/> Enable <input checked="" type="radio"/> Disable

Object	Description
• Alignment Errors	The number of alignment errors (missynchronized data packets).
• FCS Errors	A count of frames received on a particular interface that are an integral number of octets in length but do not pass the FCS check. This count does not include frames received with frame-too-long or frame-too-short error.
• Single Collision Frames	The number of successfully transmitted frames for which transmission is inhibited by exactly one collision.
• Multiple Collision Frames	A count of successfully transmitted frames for which transmission is inhibited by more than one collision.
• Deferred Transmissions	A count of frames for which the first transmission attempt on a particular interface is delayed because the medium was busy.
• Late Collision	The number of times that a collision is detected later than 512 bit-times into the transmission of a packet.
• Excessive Collision	A count of frames for which transmission on a particular interface fails due to excessive collisions. This counter does not increase when the interface is operating in full-duplex mode.
• Frame Too Long	A count of frames received on a particular interface that exceeds the maximum permitted frame size.
• Symbol Errors	The number of received and transmitted symbol errors
• Control In Unknown Opcodes	The number of received control unknown opcodes
• In Pause Frames	The number of received pause frames
• Out Pause Frames	The number of transmitted pause frames

4.3.1.3 Bandwidth Utilization

The **Bandwidth Utilization** page displays the percentage of the total available bandwidth being used on the ports. Bandwidth utilization statistics can be viewed using a line graph. The Bandwidth Utilization screen in [Figure 4-3-7](#) appears.

To view the port utilization, click on the **Port Management** folder and then the **Bandwidth Utilization** link:

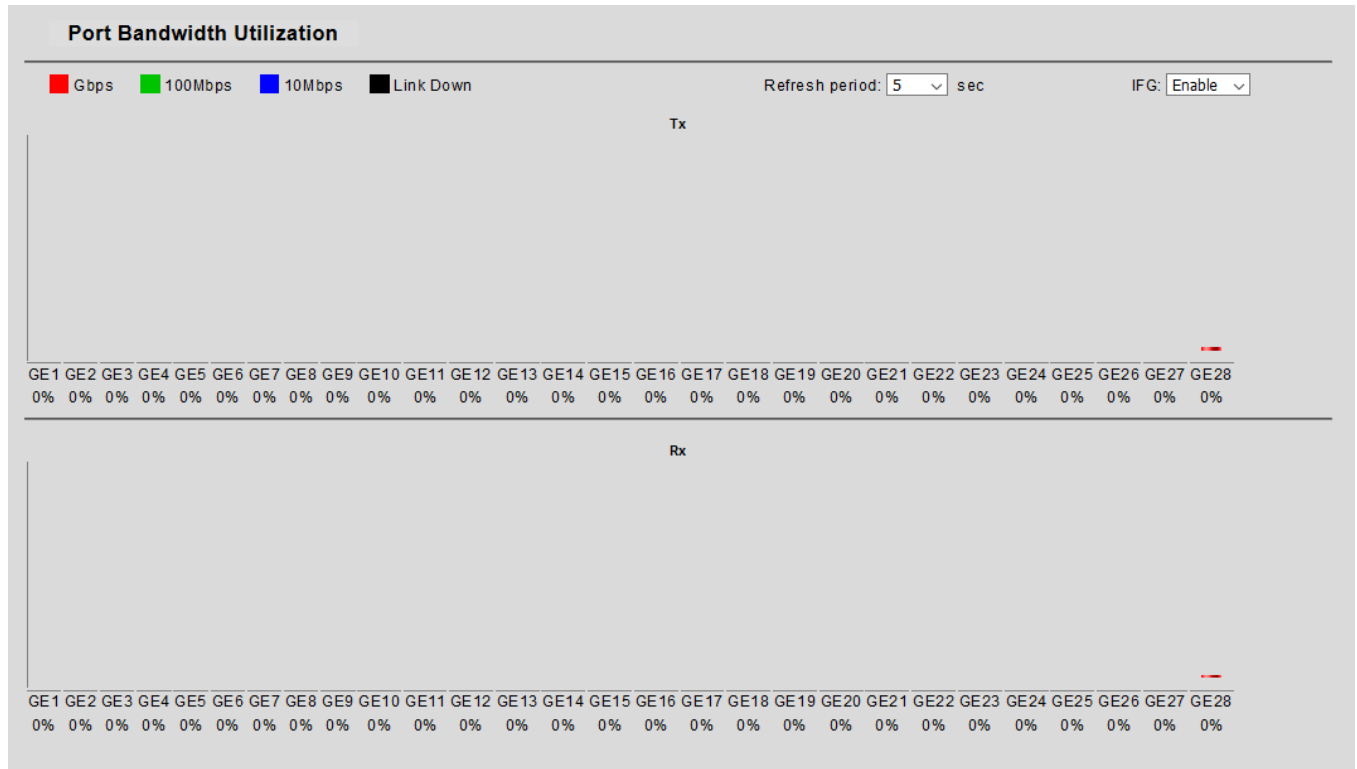

Figure 4-3-7:Port Bandwidth Utilization Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Refresh Period 	<p>This shows the period interval between last and next refresh.</p> <p>Options:</p> <ul style="list-style-type: none"> ■ 2 sec ■ 5 sec ■ 10 sec
<ul style="list-style-type: none"> IFG 	<p>Allow user to enable or disable this function.</p>

4.3.1.4 Port Mirroring

Configure port Mirroring on this page. This function provides monitoring of network traffic that forwards a copy of each incoming or outgoing packet from one port of a network switch to another port where the packet can be studied. It enables the manager to keep close track of switch performance and alter it if necessary.

- To debug network problems, selected traffic can be copied, or mirrored, to a mirror port where a frame analyzer can be attached to analyze the frame flow.
- The Managed Switch can unobtrusively mirror traffic from any port to a monitor port. You can then attach a protocol analyzer or RMON probe to this port to perform traffic analysis and verify connection integrity.

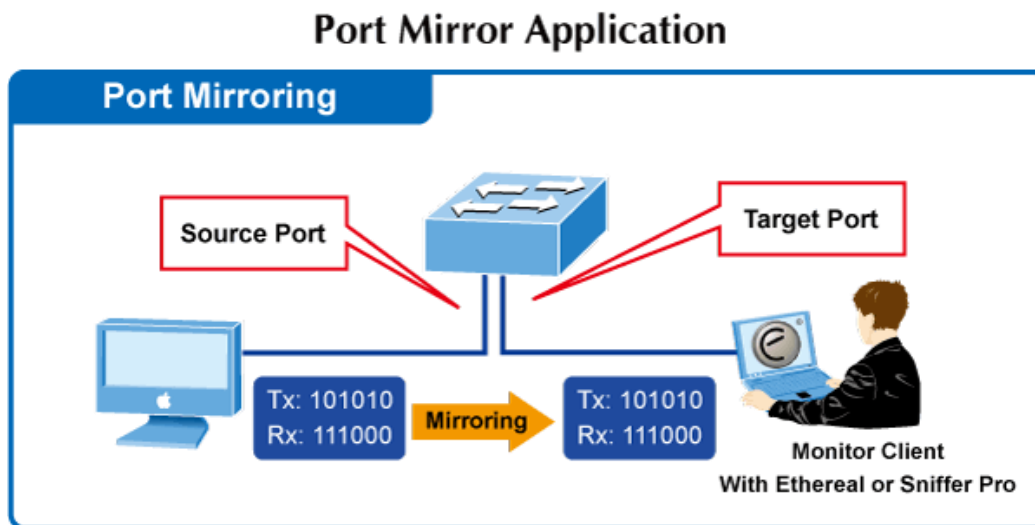

Figure 4-3-8:Port Mirror Application

The traffic to be copied to the mirror port is selected as follows:

- All frames received on a given port (also known as ingress or source mirroring).
- All frames transmitted on a given port (also known as egress or destination mirroring).

Mirror Port Configuration

The Port Mirror Configuration screens in [Figure 4-3-9](#) & [Figure 4-3-10](#) appear.

Mirror Setting	
Session ID	Select Session ▼

Information Name	Information Value
Recovery Interval	300
BPDU Guard	disabled
Self Loop	disabled
Broadcast Flood	disabled
Unknown Multicast Flood	disabled
Unicast Flood	disabled
ACL	disabled
Port Security Violation	disabled
DHCP rate limit	disabled
ARP rate limit	disabled

Figure 4-3-14: Error Disabled Information Page Screenshot

The page includes the following fields:

Object	Description
• Recovery Interval	Display the current recovery interval time.
• BPDU Guard	Display the current BPDU guard status.
• Self Loop	Display the current self loop status.
• Broadcast Flood	Display the current broadcast flood status.
• Unknown Multicast Flood	Display the current unknown multicast flood status.
• Unicast Flood	Display the current unicast flood status.
• ACL	Display the current ACL status.
• Port Security Violation	Display the current port security violation status.
• DHCP Rate Limit	Display the current DHCP rate limit status.
• ARP Rate Limit	Display the current ARP rate limit status.

4.3.1.7 Port Error Disabled Status

This page provides disable that transitions a port into error disable and the recovery options.

The ports were disabled by some protocols such as **BPDU Guard**, **Loopback** and **UDLD**. The Port Error Disable screen in [Figure 4-3-15](#) appears.

Figure 4-3-15::Port Error Disable Page Screenshot

The displayed counters are:

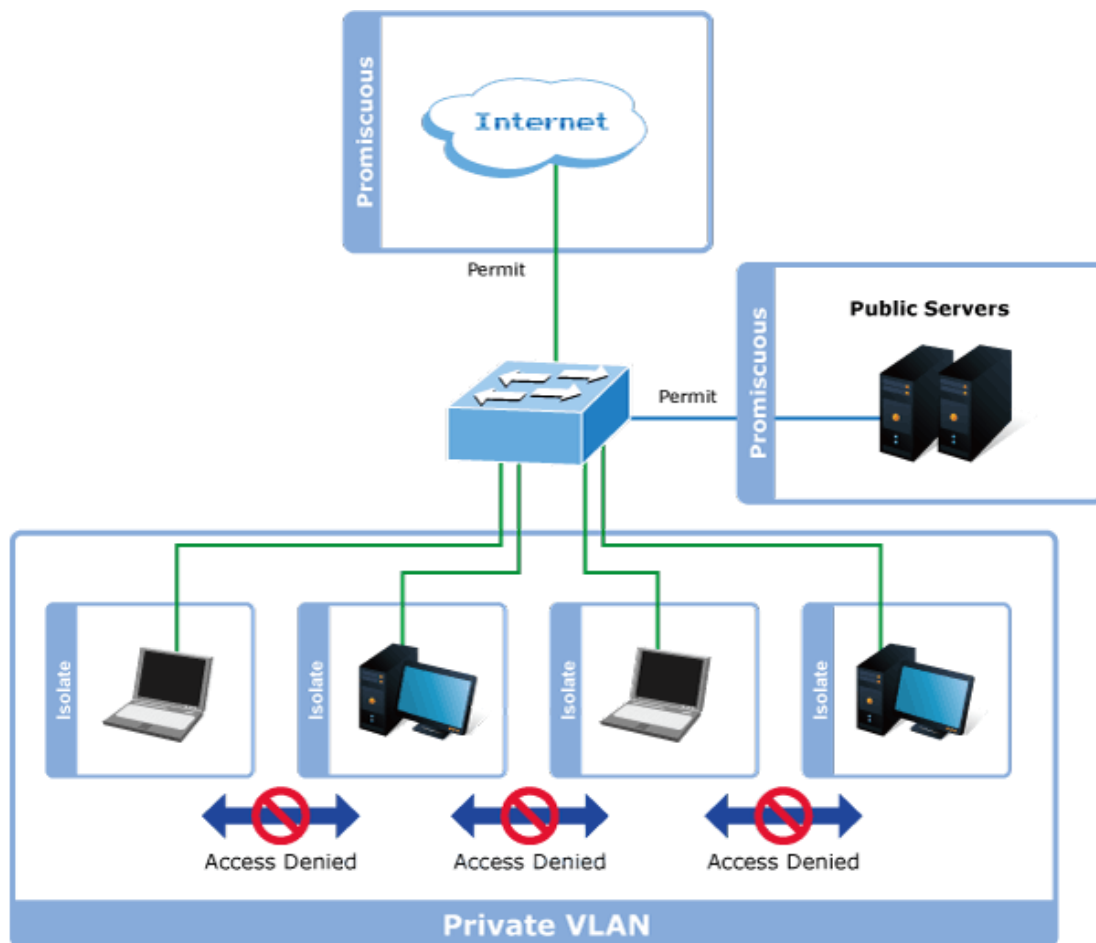

Object	Description
• Port Name	Display the port for error disable.
• Error Disable Reason	Display the error disabled reason of the port.
• Time Left (Seconds)	Display the time left.

4.3.1.8 Protected Ports

Overview

When a switch port is configured to be a member of **protected group** (also called **Private VLAN**), communication between protected ports within that group can be prevented. Two application examples are provided in this section:

- Customers connected to an ISP can be members of the protected group, but they are not allowed to communicate with each other within that VLAN.
- Servers in a farm of web servers in a Demilitarized Zone (DMZ) are allowed to communicate with the outside world and with database servers on the inside segment, but are not allowed to communicate with each other

For protected port group to be applied, the Managed switch must first be configured for standard VLAN operation. Ports in a protected port group fall into one of these two groups:

- **Promiscuous (Unprotected) ports**
 - Ports from which traffic can be forwarded to all ports in the private VLAN
 - Ports which can receive traffic from all ports in the private VLAN
- **Isolated (Protected) ports**
 - Ports from which traffic can only be forwarded to promiscuous ports in the private VLAN
 - Ports which can receive traffic from only promiscuous ports in the private VLAN

The configuration of promiscuous and isolated ports applies to all private VLANs. When traffic comes in on a promiscuous port in a private VLAN, the VLAN mask from the VLAN table is applied. When traffic comes in on an isolated port, the private VLAN mask is applied in addition to the VLAN mask from the VLAN table. This reduces the ports to which forwarding can be done to just the promiscuous ports within the private VLAN.

The port settings relate to the currently unit, as reflected by the page header. The Port Isolation Configuration screens in [Figure 4-3-16](#) & [Figure 4-3-17](#) appear.

Figure 4-3-16: Protected Ports Settings Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Port List 	Select port number for this drop down list.
<ul style="list-style-type: none"> Port Type 	Displays protected port types. <ul style="list-style-type: none"> - Protected: A single stand-alone VLAN that contains one promiscuous port and one or more isolated (or host) ports. This VLAN conveys traffic between the isolated ports and a lone promiscuous port. - Unprotected: A promiscuous port can communicate with all the interfaces within a private VLAN. This is the default setting.

Buttons

Apply: Click to apply changes.

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Protected Ports 	Display the current protected ports.
<ul style="list-style-type: none"> Unprotected Ports 	Display the current unprotected ports.

4.3.1.9 EEE

What is EEE

EEE is a power saving option that reduces the power usage when there is low or no traffic utilization. EEE works by powering down circuits when there is no traffic. When a port gets data to be transmitted all circuits are powered up. The time it takes to power up the circuits is named wakeup time. The default wakeup time is 17 us for 1Gbit links and 30 us for other link speeds. EEE devices must agree upon the value of the wakeup time in order to make sure that both the receiving and transmitting device has all circuits powered up when traffic is transmitted. The devices can exchange wakeup time information using the LLDP protocol. EEE works for ports in auto-negotiation mode, where the port is negotiated to either 1G or 100 Mbit full duplex mode. For ports that are not EEE-capable the corresponding EEE checkboxes are grayed out and thus impossible to enable EEE for. The EEE port settings relate to the currently unit, as reflected by the page header.

When a port is powered down for saving power, outgoing traffic is stored in a buffer until the port is powered up again. Because there are some overhead in turning the port down and up, more power can be saved if the traffic can be buffered up until a large burst of traffic can be transmitted. Buffering traffic will give some latency in the traffic.

The EEE Port Settings screen in [Figure 4-3-18](#) & [Figure 4-3-19](#) appears.

Figure 4-3-18: EEE Port Settings Page Screenshot

The page includes the following fields:

The page includes the following fields:

Object	Description
• Port	The switch port number of the logical port.
• EEE State	Display the current EEE state.

4.3.2 Link Aggregation

Port Aggregation optimizes port usage by linking a group of ports together to form a single Link Aggregated Groups (LAGs). Port Aggregation multiplies the bandwidth between the devices, increases port flexibility, and provides link redundancy.

Each LAG is composed of ports of the same speed, set to full-duplex operations. Ports in a LAG can be of different media types (UTP/Fiber, or different fiber types) provided they operate at the same speed.

Aggregated Links can be assigned manually (**Port Trunk**) or automatically by enabling Link Aggregation Control Protocol (**LACP**) on the relevant links.

Aggregated Links are treated by the system as a single logical port. Specifically, the Aggregated Link has similar port attributes to a non-aggregated port, including auto-negotiation, speed, duplex setting, etc.

The device supports the following Aggregation links :

- **Static LAGs (Port Trunk)** – Force aggregated selected ports to be a trunk group.
- **Link Aggregation Control Protocol (LACP)** LAGs - LACP LAG negotiate Aggregated Port links with other LACP ports located on a different device. If the other device ports are also LACP ports, the devices establish a LAG between them.

Figure 4-3-20: Link Aggregation

The **Link Aggregation Control Protocol (LACP)** provides a standardized means for exchanging information between Partner Systems that require high-speed redundant links. Link aggregation lets you group up to eight consecutive ports into a single dedicated connection. This feature can expand bandwidth to a device on the network. LACP operation requires full-duplex mode. For more detailed information, refer to the IEEE 802.3ad standard.

Port link aggregations can be used to increase the bandwidth of a network connection or to ensure fault recovery. Link aggregation lets you group up to 8 consecutive ports into a single dedicated connection between any two the Switch or other Layer 2 switches. However, before making any physical connections between devices, use the Link Aggregation Configuration menu to specify the link aggregation on the devices at both ends. When using a port link aggregation, note that:

- The ports used in a link aggregation must all be of the same media type (RJ45, 100 Mbps fiber).
- The ports that can be assigned to the same link aggregation have certain other restrictions (see below).
- Ports can only be assigned to one link aggregation.
- The ports at both ends of a connection must be configured as link aggregation ports.
- None of the ports in a link aggregation can be configured as a mirror source port or a mirror target port.
- All of the ports in a link aggregation have to be treated as a whole when moved from/to, added or deleted from a VLAN.
- The Spanning Tree Protocol will treat all the ports in a link aggregation as a whole.
- Enable the link aggregation prior to connecting any cable between the switches to avoid creating a data loop.
- Disconnect all link aggregation port cables or disable the link aggregation ports before removing a port link aggregation to avoid creating a data loop.

It allows a maximum of 8 ports to be aggregated at the same time. The Managed Switch supports Gigabit Ethernet ports (up to 8 groups). If the group is defined as an LACP static link aggregation group, then any extra ports selected are placed in a standby mode for redundancy if one of the other ports fails. If the group is defined as a local static link aggregation group, then the number of ports must be the same as the group member ports.

Use the Link Aggregation Menu to display or configure the Trunk function. This section has the following items:

■ LAG Setting	Configures load balance algorithm configuration settings
■ LAG Management	Configures LAG configuration settings
■ LAG Port Setting	Configures LAG port settings
■ LACP Setting	Configures LACP priority settings
■ LACP Port Setting	Configure LACP configuration settings
■ LAG Status	Display LAG status / LACP information

4.3.2.1 LAG Setting

This page allows configuring load balance algorithm configuration settings. The LAG Setting screens in [Figure 4-3-21](#) & [Figure 4-3-22](#) appear.

Figure 4-3-21: LAG Setting Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Load Balance Algorithm 	Select load balance algorithm mode: <ul style="list-style-type: none"> ■ MAC Address: The MAC address can be used to calculate the port for the frame. ■ IP/MAC Address: The IP and MAC address can be used to calculate the port for the frame.

4.3.3 VLAN

4.3.3.1 VLAN Overview

A **Virtual Local Area Network (VLAN)** is a network topology configured according to a logical scheme rather than the physical layout. VLAN can be used to combine any collection of LAN segments into an autonomous user group that appears as a single LAN. VLAN also logically segment the network into different broadcast domains so that packets are forwarded only between ports within the VLAN. Typically, a VLAN corresponds to a particular subnet, although not necessarily.

VLAN can enhance performance by conserving bandwidth, and improve security by limiting traffic to specific domains.

A VLAN is a collection of end nodes grouped by logic instead of physical location. End nodes that frequently communicate with each other are assigned to the same VLAN, regardless of where they are physically on the network. Logically, a VLAN can be equated to a broadcast domain, because broadcast packets are forwarded to only members of the VLAN on which the broadcast was initiated.

1. No matter what basis is used to uniquely identify end nodes and assign these nodes VLAN membership, packets cannot cross VLAN without a network device performing a routing function between the VLAN.
2. The Managed Switch supports IEEE 802.1Q VLAN. The port untagging function can be used to remove the 802.1 tag from packet headers to maintain compatibility with devices that are tag-unaware.

The Managed Switch's default is to assign all ports to a single 802.1Q VLAN named **DEFAULT_VLAN**. As new VLAN is created, the member ports assigned to the new VLAN will be removed from the DEFAULT_VLAN port member list. **The DEFAULT_VLAN has a VID = 1.**

This section has the following items:

- | | |
|--------------------------------------|---|
| ■ Management VLAN | Configures the management VLAN |
| ■ Create VLAN | Creates the VLAN group |
| ■ Interface Settings | Configures mode and PVID on the VLAN port |
| ■ Port to VLAN | Configures the VLAN membership |

4.3.3.2 IEEE 802.1Q VLAN

In large networks, routers are used to isolate broadcast traffic for each subnet into separate domains. This Managed Switch provides a similar service at Layer 2 by using VLANs to organize any group of network nodes into separate broadcast domains. VLANs confine broadcast traffic to the originating group, and can eliminate broadcast storms in large networks. This also provides a more secure and cleaner network environment.

An IEEE 802.1Q VLAN is a group of ports that can be located anywhere in the network, but communicate as though they belong to the same physical segment.

VLANs help to simplify network management by allowing you to move devices to a new VLAN without having to change any physical connections. VLANs can be easily organized to reflect departmental groups (such as Marketing or R&D), usage groups (such as e-mail), or multicast groups (used for multimedia applications such as videoconferencing).

VLANs provide greater network efficiency by reducing broadcast traffic, and allow you to make network changes without having to update IP addresses or IP subnets. VLANs inherently provide a high level of network security since traffic must pass through a configured Layer 3 link to reach a different VLAN.

This Managed Switch supports the following VLAN features:

- Up to 255 VLANs based on the IEEE 802.1Q standard
- Port overlapping, allowing a port to participate in multiple VLANs
- End stations can belong to multiple VLANs
- Passing traffic between VLAN-aware and VLAN-unaware devices

■ IEEE 802.1Q Standard

IEEE 802.1Q (tagged) VLAN are implemented on the Switch. 802.1Q VLAN require tagging, which enables them to span the entire network (assuming all switches on the network are IEEE 802.1Q-compliant).

VLAN allow a network to be segmented in order to reduce the size of broadcast domains. All packets entering a VLAN will only be forwarded to the stations (over IEEE 802.1Q enabled switches) that are members of that VLAN, and this includes broadcast, multicast and unicast packets from unknown sources.

VLAN can also provide a level of security to your network. IEEE 802.1Q VLAN will only deliver packets between stations that are members of the VLAN. Any port can be configured as either **tagging** or **untagging**:

- The untagging feature of IEEE 802.1Q VLAN allows VLAN to work with legacy switches that don't recognize VLAN tags in packet headers.
- The tagging feature allows VLAN to span multiple 802.1Q-compliant switches through a single physical connection and allows Spanning Tree to be enabled on all ports and work normally.

Some relevant terms:

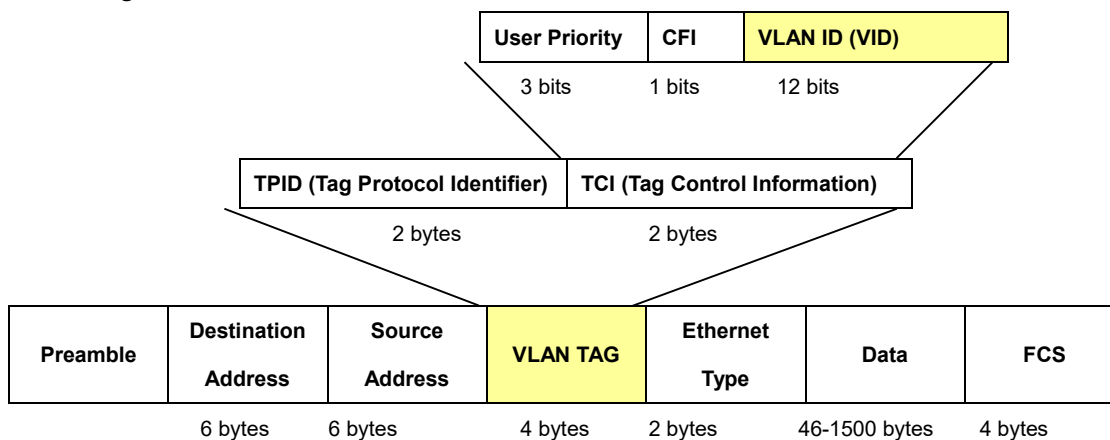

- **Tagging** - The act of putting 802.1Q VLAN information into the header of a packet.
- **Untagging** - The act of stripping 802.1Q VLAN information out of the packet header.

802.1Q VLAN Tags

The figure below shows the 802.1Q VLAN tag. There are four additional octets inserted after the source MAC address. Their presence is indicated by a value of **0x8100** in the Ether Type field. When a packet's Ether Type field is equal to 0x8100, the packet carries the IEEE 802.1Q/802.1p tag. The tag is contained in the following two octets and consists of 3 bits of user priority, 1 bit of Canonical Format Identifier (CFI - used for encapsulating Token Ring packets so they can be carried across Ethernet backbones), and 12 bits of **VLAN ID (VID)**. The 3 bits of user priority are used by 802.1p. The VID is the VLAN identifier and is used by the 802.1Q standard. Because the VID is 12 bits long, 4094 unique VLAN can be identified.

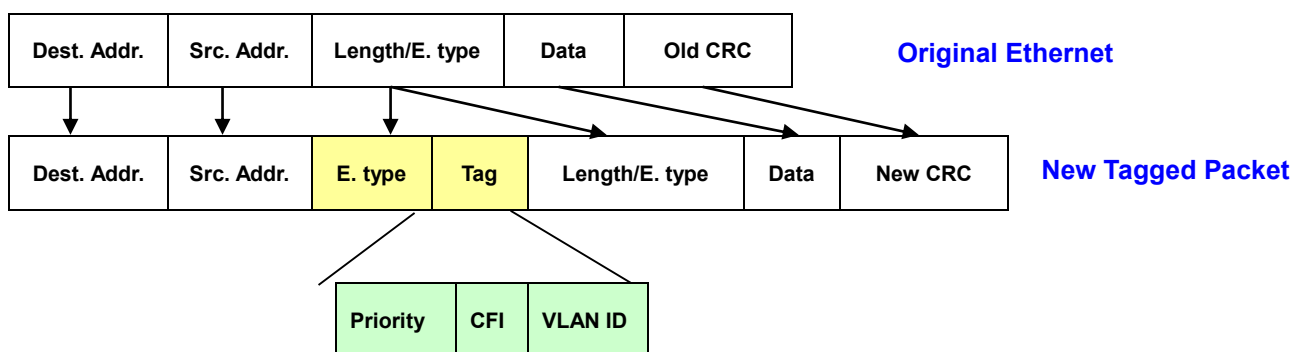

The tag is inserted into the packet header making the entire packet longer by 4 octets. All of the information originally contained in the packet is retained.

802.1Q Tag

The Ether Type and VLAN ID are inserted after the MAC source address, but before the original Ether Type/Length or Logical Link Control. Because the packet is now a bit longer than it was originally, the Cyclic Redundancy Check (CRC) must be recalculated.

Adding an IEEE802.1Q Tag

■ Port VLAN ID

Packets that are tagged (are carrying the 802.1Q VID information) can be transmitted from one 802.1Q compliant network device to another with the VLAN information intact. This allows 802.1Q VLAN to span network devices (and indeed, the entire network – if all network devices are 802.1Q compliant).

Every physical port on a switch has a PVID. 802.1Q ports are also assigned a PVID, for use within the switch. If no VLAN are defined on the switch, all ports are then assigned to a default VLAN with a PVID equal to 1. Untagged packets are assigned the PVID of the port on which they were received. Forwarding decisions are based upon this PVID, in so far as VLAN are concerned. Tagged packets are forwarded according to the VID contained within the tag. Tagged packets are also assigned a PVID, but the PVID is not used to make packet forwarding decisions, the VID is.

Tag-aware switches must keep a table to relate PVID within the switch to VID on the network. The switch will compare the VID of a packet to be transmitted to the VID of the port that is to transmit the packet. If the two VID are different the switch will drop the packet. Because of the existence of the PVID for untagged packets and the VID for tagged packets, tag-aware and tag-unaware network devices can coexist on the same network.

A switch port can have only one PVID, but can have as many VID as the switch has memory in its VLAN table to store them.

Because some devices on a network may be tag-unaware, a decision must be made at each port on a tag-aware device before packets are transmitted – should the packet to be transmitted have a tag or not? If the transmitting port is connected to a tag-unaware device, the packet should be untagged. If the transmitting port is connected to a tag-aware device, the packet should be tagged.

■ Default VLANs

The Switch initially configures one VLAN, VID = 1, called **"default."** The factory default setting assigns all ports on the Switch to the **"default"**. As new VLAN are configured in Port-based mode, their respective member ports are removed from the "default."

■ Assigning Ports to VLANs

Before enabling VLANs for the switch, you must first assign each port to the VLAN group(s) in which it will participate. By default all ports are assigned to VLAN 1 as untagged ports. Add a port as a tagged port if you want it to carry traffic for one or more VLANs, and any intermediate network devices or the host at the other end of the connection supports VLANs. Then assign ports on the other VLAN-aware network devices along the path that will carry this traffic to the same VLAN(s), either manually or dynamically using GVRP. However, if you want a port on this switch to participate in one or more VLANs, but none of the intermediate network devices nor the host at the other end of the connection supports VLANs, then you should add this port to the VLAN as an untagged port.

VLAN-tagged frames can pass through VLAN-aware or VLAN-unaware network interconnection devices, but the VLAN tags should be stripped off before passing it on to any end-node host that does not support VLAN tagging.

■ VLAN Classification

When the switch receives a frame, it classifies the frame in one of two ways. If the frame is untagged, the switch assigns the frame to an associated VLAN (based on the default VLAN ID of the receiving port). But if the frame is tagged, the switch uses the tagged VLAN ID to identify the port broadcast domain of the frame.

■ Port Overlapping

Port overlapping can be used to allow access to commonly shared network resources among different VLAN groups, such as file servers or printers. Note that if you implement VLANs which do not overlap, but still need to communicate, you can connect them by enabled routing on this switch.

■ Untagged VLANs

Untagged (or static) VLANs are typically used to reduce broadcast traffic and to increase security. A group of network users assigned to a VLAN form a broadcast domain that is separate from other VLANs configured on the switch. Packets are forwarded only between ports that are designated for the same VLAN. Untagged VLANs can be used to manually isolate user groups or subnets.

4.3.3.3 Management VLAN

Configure Management VLAN on this page. The screens in [Figure 4-3-33](#) & [Figure 4-3-34](#) appear.

The screenshot shows a web interface titled "Management VLAN Setting". It features a blue header bar with the title. Below the header, there is a form with a label "Management VLAN" and a dropdown menu showing "default(1)". An "Apply" button is located at the bottom left of the form.

Figure 4-3-33: Management VLAN Setting Page Screenshot

The page includes the following fields:

Object	Description
• Management VLAN	Provide the managed VLAN ID

Buttons

: Click to apply changes.

The screenshot shows a web interface titled "Management VLAN State". It features a blue header bar with the title. Below the header, there is a table with two columns: "Config Name" and "Config Value". The table contains one row with "Management VLAN" in the first column and "1" in the second column.

Figure 4-3-34: Management VLAN State Page Screenshot

The page includes the following fields:

Object	Description
• Management VLAN	Display the current management VLAN.

4.3.3.4 Create VLAN

Create/delete VLAN on this page. The screens in [Figure 4-3-35](#) & [Figure 4-3-36](#) appear.

The screenshot shows the 'VLAN Setting' page. It features a table with three columns: 'VLAN LIST', 'VLAN Action', and 'VLAN Name Prefix'. Below the table, there is an 'Apply' button. The 'VLAN Action' column contains radio buttons for 'Add' (selected) and 'Delete'.

VLAN LIST	VLAN Action	VLAN Name Prefix
<input type="text"/>	<input checked="" type="radio"/> Add <input type="radio"/> Delete	<input type="text"/>

Figure 4-3-35: VLAN Setting Page Screenshot

The page includes the following fields:

Object	Description
• VLAN List	Indicates the ID of this particular VLAN.
• VLAN Action	This column allows users to add or delete VLANs.
• VLAN Name Prefix	Indicates the name of this particular VLAN.

Buttons

: Click to apply changes.

The screenshot shows the 'VLAN Table' page. It includes a table with columns: 'VLAN ID', 'VLAN Name', 'VLAN Type', and 'Modify'. The first row shows '1' for VLAN ID, 'default' for VLAN Name, and 'Default' for VLAN Type. There is an 'Edit' button in the 'Modify' column. Above the table, there are navigation buttons: 'FIRST', 'PREV', '1', 'NEXT', and 'LAST'.

VLAN ID	VLAN Name	VLAN Type	Modify
1	default	Default	<input type="button" value="Edit"/>

Figure 4-3-36: VLAN Table Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Display the current VLAN ID entry.
• VLAN Name	Display the current VLAN ID name.
• VLAN Type	Display the current VLAN ID type.
• Modify	Click <input type="button" value="Edit"/> to modify VLAN configuration.

4.3.3.5 Interface Settings

This page is used for configuring the Managed Switch port VLAN. The VLAN per Port Configuration Page contains fields for managing ports that are part of a VLAN. The port **default VLAN ID (PVID)** is configured on the VLAN Port Configuration Page. All untagged packets arriving to the device are tagged by the ports PVID.

Understand nomenclature of the Switch

■ IEEE 802.1Q Tagged and Untagged

Every port on an 802.1Q compliant switch can be configured as tagged or untagged.

- **Tagged:** Ports with tagging enabled will put the VID number, priority and other VLAN information into the header of all packets that flow into those ports. If a packet has previously been tagged, the port will not alter the packet, thus keeping the VLAN information intact. The VLAN information in the tag can then be used by other 802.1Q compliant devices on the network to make packet-forwarding decisions.
- **Untagged:** Ports with untagging enabled will strip the 802.1Q tag from all packets that flow into those ports. If the packet doesn't have an 802.1Q VLAN tag, the port will not alter the packet. Thus, all packets received by and forwarded by an untagging port will have no 802.1Q VLAN information. (Remember that the PVID is only used internally within the Switch). Untagging is used to send packets from an 802.1Q-compliant network device to a non-compliant network device.

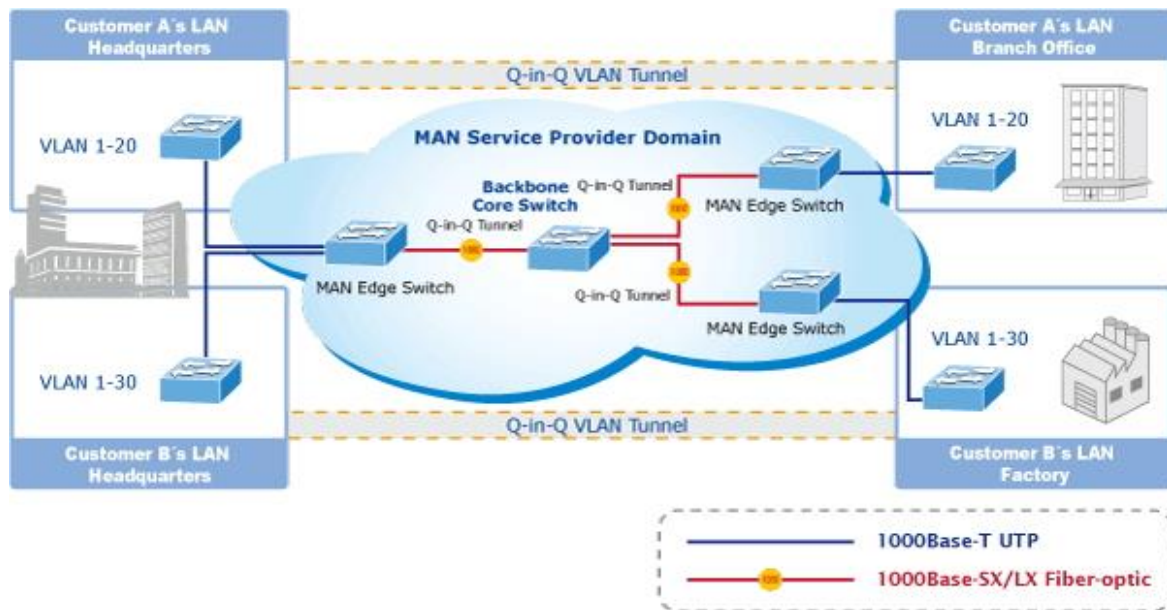

Frame Income Frame Leave	Income Frame is tagged	Income Frame is untagged
Leave port is tagged	Frame remains tagged	Tag is inserted
Leave port is untagged	Tag is removed	Frame remain untagged

Table 4-5-1: Ingress / Egress Port with VLAN VID Tag / Untag Table

■ IEEE 802.1Q Tunneling (Q-in-Q)

IEEE 802.1Q Tunneling (QinQ) is designed for service providers carrying traffic for multiple customers across their networks. QinQ tunneling is used to maintain customer-specific VLAN and Layer 2 protocol configurations even when different customers use the same internal VLAN IDs. This is accomplished by inserting **Service Provider VLAN (SPVLAN)** tags into the customer's frames when they enter the service provider's network, and then stripping the tags when the frames leave the network.

A service provider's customers may have specific requirements for their internal VLAN IDs and number of VLANs supported. VLAN ranges required by different customers in the same service-provider network might easily overlap, and traffic passing through the infrastructure might be mixed. Assigning a unique range of VLAN IDs to each customer would restrict customer configurations, require intensive processing of VLAN mapping tables, and could easily exceed the maximum VLAN limit of 4096.

The Managed Switch supports multiple VLAN tags and can therefore be used in MAN applications as a provider bridge, aggregating traffic from numerous independent customer LANs into the **MAN (Metro Access Network)** space. One of the purposes of the provider bridge is to recognize and use VLAN tags so that the VLANs in the MAN space can be used independent of the customers' VLANs. This is accomplished by adding a VLAN tag with a MAN-related VID for frames entering the MAN. When leaving the MAN, the tag is stripped and the original VLAN tag with the customer-related VID is again available.

This provides a tunneling mechanism to connect remote customer VLANs through a common MAN space without interfering with the VLAN tags. All tags use EtherType **0x8100** or **0x88A8**, where 0x8100 is used for customer tags and 0x88A8 are used for service provider tags.

In cases where a given service VLAN only has two member ports on the switch, the learning can be disabled for the particular VLAN and can therefore rely on flooding as the forwarding mechanism between the two ports. This way, the MAC table requirements is reduced.

Edit Interface Setting

The Edit Interface Setting/Status screens in [Figure 4-3-37](#) & [Figure 4-3-38](#) appear.

Figure 4-3-40: Port VLAN Membership Table Page Screenshot

The page includes the following fields:

Object	Description
• Port	The switch port number of the logical port.
• Mode	Display the current VLAN mode.
• Administrative VLANs	Display the current administrative VLANs.
• Operational VLANs	Display the current operational VLANs.
• Modify	Click Edit to modify VLAN membership.

4.3.3.8 Protocol VLAN Group Setting

The network devices required to support multiple protocols cannot be easily grouped into a common VLAN. This may require non-standard devices to pass traffic between different VLANs in order to encompass all the devices participating in a specific protocol. This kind of configuration deprives users of the basic benefits of VLANs, including security and easy accessibility.

To avoid these problems, you can configure this Managed Switch with protocol-based VLANs that divide the physical network into logical VLAN groups for each required protocol. When a frame is received at a port, its VLAN membership can then be determined based on the protocol type being used by the inbound packets.

Command Usage

To configure protocol-based VLANs, follow these steps:

1. First configure **VLAN groups for the protocols** you want to use. Although not mandatory, we suggest configuring a separate VLAN for each major protocol running on your network. Do not add port members at this time.
2. Create a **protocol group** for each of the protocols you want to assign to a VLAN using the Protocol VLAN Configuration page.
3. Then map the protocol for each interface to the appropriate VLAN using the Protocol VLAN Port Configuration page.

This page allows you to configure protocol-based VLAN Group Setting. The protocol-based VLAN screens in [Figure 4-3-41](#) & [Figure 4-3-42](#) appear.

Figure 4-3-41: Add Protocol VLAN Group Page Screenshot

The page includes the following fields:

Object	Description
• Group ID	Protocol Group ID assigned to the Special Protocol VLAN Group.
• Frame Type	<p>Frame Type can have one of the following values:</p> <ul style="list-style-type: none"> ■ Ethernet II ■ IEEE802.3_LLC_Other ■ RFC_1042 <p>Note: On changing the Frame type field, valid value of the following text field will vary depending on the new frame type you selected.</p>
• Protocol Value (0x0600-0xFFFE)	<p>Valid value that can be entered in this text field depends on the option selected from the preceding Frame Type selection menu.</p> <p>Valid values for frame type ranges from 0x0600-0xfffe</p>

• VLAN ID	Display the current VLAN ID.
• Delete	Click Delete to delete the group ID entry.

4.3.3.10 GVRP Setting

GARP VLAN Registration Protocol (GVRP) defines a way for switches to exchange VLAN information in order to register VLAN members on ports across the network.

VLANs are **dynamically** configured based on **join messages** issued by host devices and propagated throughout the network.

GVRP must be enabled to permit automatic VLAN registration, and to support VLANs which extend beyond the local switch.

The GVRP Global Setting/Information screens in [Figure 4-3-45](#) & [Figure 4-3-46](#) appear.

Figure 4-3-45: GVRP Global Setting Page Screenshot

The page includes the following fields:

Object	Description
• GVRP	Controls whether GVRP is enabled or disabled on this switch.

Buttons**Apply**

: Click to apply changes.

Information Name	Information Value
GVRP Status	Disabled
Join Timeout	200 millisecond
Leave Timeout	600 millisecond
LeaveAll Timeout	10000 millisecond

Figure 4-3-46: GVRP Global Setting Page Screenshot

The page includes the following fields:

Object	Description
• GVRP Status	Display the current GVRP status.

Select Ports	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled	Normal	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled

Apply

Figure 4-3-47: GVRP Global Setting Page Screenshot

The page includes the following fields:

Object	Description
• Port Select	Select port for this drop down list to assign protocol VLAN port.
• GVRP Enabled	Controls whether GVRP is enabled or disabled on port.
• Registration Mode	By default GVRP ports are in normal registration mode. These ports use GVRP join messages from neighboring switches to prune the VLANs running across the 802.1Q trunk link. If the device on the other side is not capable of sending GVRP messages, or if you do not want to allow the switch to prune any of the VLANs, use the fixed mode. Fixed mode ports will forward for all VLANs that exist in the switch database. Ports in forbidden mode forward only for VLAN 1.
• VLAN Creation	GVRP can dynamically create VLANs on switches for trunking purposes. By enabling GVRP dynamic VLAN creation, a switch will add VLANs to its database when it receives GVRP join messages about VLANs it does not have.

4.3.3.14 VLAN setting example:

- Separate VLANs
- 802.1Q VLAN Trunk

4.3.3.14.1 Two separate 802.1Q VLANs

The diagram shows how the Managed Switch handles Tagged and Untagged traffic flow for two VLANs. VLAN Group 2 and VLAN Group 3 are separated VLANs. Each VLAN isolates network traffic so only members of the VLAN receive traffic from the same VLAN members. The screen in [Figure 4-3-52](#) appears and [Table 4-3-1](#) describes the port configuration of the Managed Switches.

Figure 4-3-52: Two Separate VLAN Diagrams

VLAN Group	VID	Untagged Members	Tagged Members
VLAN Group 1	1	Port-7~Port-8	N/A
VLAN Group 2	2	Port-1,Port-2	Port-3
VLAN Group 3	3	Port-4,Port-5	Port-6

Table 4-3-1 VLAN and Port Configuration

The scenario described as follows:

■ Untagged packet entering VLAN 2

1. While **[PC-1]** transmits an **untagged** packet enters **Port-1**, the Managed Switch will tag it with a **VLAN Tag=2**. **[PC-2]** and **[PC-3]** will received the packet through **Port-2** and **Port-3**.
2. **[PC-4]**, **[PC-5]** and **[PC-6]** received no packet.
3. While the packet leaves **Port-2**, it will be stripped away its tag becoming an **untagged** packet.
4. While the packet leaves **Port-3**, it will keep as a **tagged** packet with **VLAN Tag=2**.

■ Tagged packet entering VLAN 2

1. While **[PC-3]** transmits a **tagged** packet with **VLAN Tag=2** enters **Port-3**, **[PC-1]** and **[PC-2]** will receive the packet through **Port-1** and **Port-2**.
2. While the packet leaves **Port-1** and **Port-2**, it will be stripped away its tag becoming an **untagged** packet.

■ Untagged packet entering VLAN 3

1. While **[PC-4]** transmits an **untagged** packet enters **Port-4**, the switch will tag it with a **VLAN Tag=3**. **[PC-5]** and **[PC-6]** will receive the packet through **Port-5** and **Port-6**.
2. While the packet leaves **Port-5**, it will be stripped away its tag becoming an **untagged** packet.
3. While the packet leaves **Port-6**, it will keep as a **tagged** packet with **VLAN Tag=3**.

Note

In this example, VLAN Group 1 is set as default VLAN, but only focuses on VLAN 2 and VLAN 3 traffic flow.

Setup Steps

1. Create VLAN Group 2 and 3

Add VLAN group 2 and group 3

VLAN Table		
FIRST	PREV	1
VLAN ID	VLAN Name	VLAN Type
1	default	Default
2	20002	Static
3	30003	Static

2. Assign VLAN mode and PVID to each port:

Port-1, Port-2 and Port-3 : VLAN Mode = Hybrid, PVID=2

Port-4, Port-5 and Port-6 : VLAN Mode = Hybrid, PVID=3

Port VLAN Status			
Port	Interface VLAN Mode	PVID	Accept Frame Type
GE1	Hybrid	2	ALL
GE2	Hybrid	2	ALL
GE3	Hybrid	2	ALL
GE4	Hybrid	3	ALL
GE5	Hybrid	3	ALL
GE6	Hybrid	3	ALL

3. Assign Tagged/Untagged to each port:

VLAN ID = 2:

Port-1 & 2 = Untagged,

Port-3 = Tagged,

Port -4~6 = Excluded.

Port to VLAN Settings			
VLAN ID : 2

4.3.3.14.2 VLAN Trunking between two 802.1Q aware switches

In most cases, they are used for “Uplink” to other switches. VLANs are separated at different switches, but they need to access other switches within the same VLAN group. The screen in [Figure 4-3-53](#) appears.

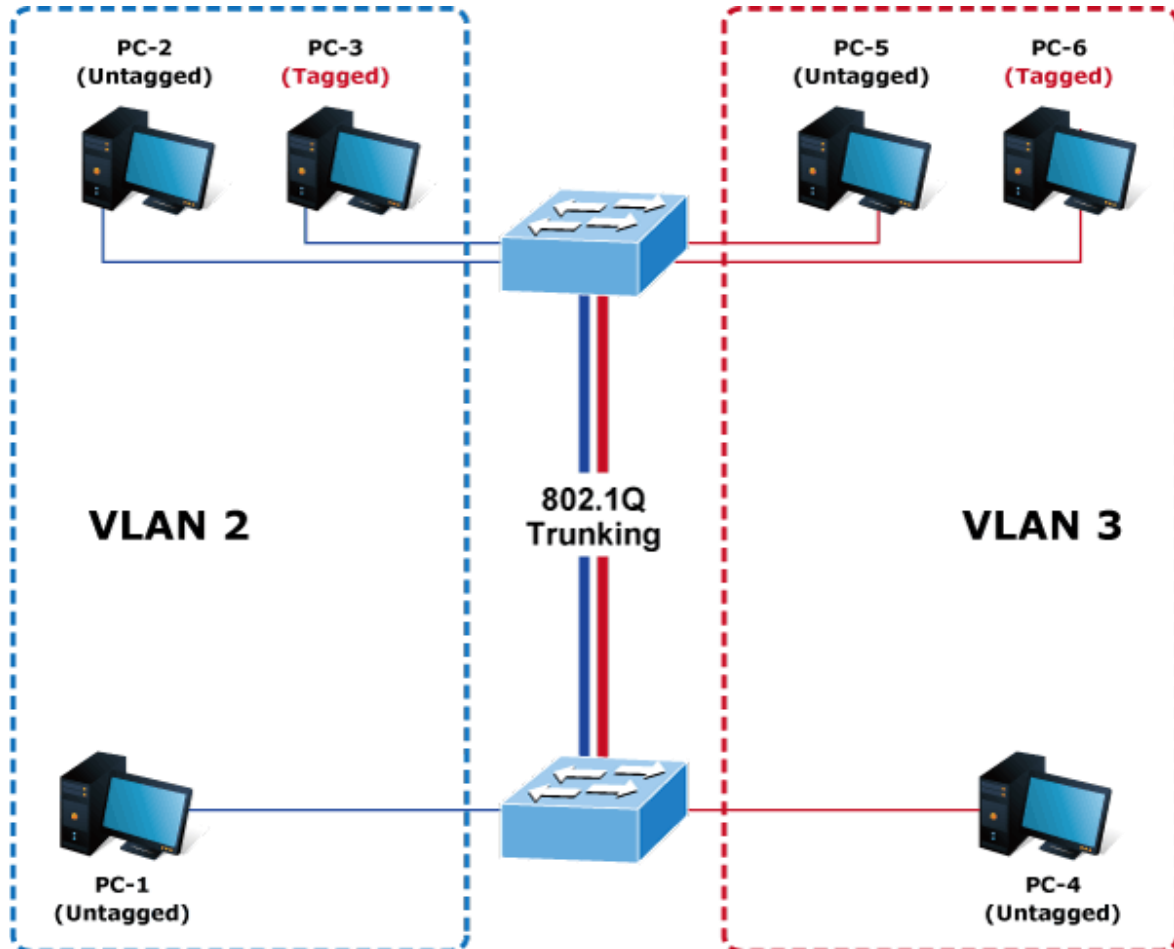

Figure 4-3-53: VLAN Trunking between two 802.1Q aware switches

Setup steps

1. Create VLAN Group 2 and 3

Add VLAN group 2 and group 3

VLAN Table		
FIRST	PREV	1 NEXT LAST
VLAN ID	VLAN Name	VLAN Type
1	default	Default
2	20002	Static
3	30003	Static

2. Assign VLAN mode and PVID to each port:

Port-1, Port-2 and Port-3 : VLAN Mode = Hybrid, PVID=2

Port-4, Port-5 and Port-6 : VLAN Mode = Hybrid, PVID=3

Port-7 : VLAN Mode = Hybrid, PVID=1

Port VLAN Status			
Port	Interface VLAN Mode	PVID	Accept Frame Type
GE1	Hybrid	2	ALL
GE2	Hybrid	2	ALL
GE3	Hybrid	2	ALL
GE4	Hybrid	3	ALL
GE5	Hybrid	3	ALL
GE6	Hybrid	3	ALL
GE7	Hybrid	1	ALL

3. Assign Tagged/Untagged to each port:

VLAN ID = 1:

Port-1~6 = Untagged,

Port -7 = Excluded.

Port to VLAN Settings			
VLAN ID : 1			
Port	Interface VLAN Mode	Membership	PVID
GE1	Hybrid	<input type="radio"/> Forbidden <input type="radio"/> Excluded <input type="radio"/> Tagged <input checked="" type="radio"/> Untagged	<input type="checkbox"/>

4.3.4 Spanning Tree Protocol

4.3.4.1 Theory

The Spanning Tree Protocol can be used to detect and disable network loops, and to provide backup links between switches, bridges or routers. This allows the switch to interact with other bridging devices in your network to ensure that only one route exists between any two stations on the network, and provide backup links which automatically take over when a primary link goes down. The spanning tree algorithms supported by this switch include these versions:

- **STP – Spanning Tree Protocol (IEEE 802.1D)**
- **RSTP – Rapid Spanning Tree Protocol (IEEE 802.1w)**
- **MSTP – Multiple Spanning Tree Protocol (IEEE 802.1s)**

The **IEEE 802.1D Spanning Tree** Protocol and **IEEE 802.1w Rapid Spanning Tree** Protocol allow for the blocking of links between switches that form loops within the network. When multiple links between switches are detected, a primary link is established. Duplicated links are blocked from use and become standby links. The protocol allows for the duplicate links to be used in the event of a failure of the primary link. Once the Spanning Tree Protocol is configured and enabled, primary links are established and duplicated links are blocked automatically. The reactivation of the blocked links (at the time of a primary link failure) is also accomplished automatically without operator intervention.

This automatic network reconfiguration provides maximum uptime to network users. However, the concepts of the Spanning Tree Algorithm and protocol are a complicated and complex subject and must be fully researched and understood. It is possible to cause serious degradation of the performance of the network if the Spanning Tree is incorrectly configured. Please read the following before making any changes from the default values.

The Switch STP performs the following functions:

- Creates a single spanning tree from any combination of switching or bridging elements.
- Creates multiple spanning trees – from any combination of ports contained within a single switch, in user specified groups.
- Automatically reconfigures the spanning tree to compensate for the failure, addition, or removal of any element in the tree.
- Reconfigures the spanning tree without operator intervention.

Bridge Protocol Data Units

For STP to arrive at a stable network topology, the following information is used:

- The unique switch identifier
- The path cost to the root associated with each switch port
- The port identifier

STP communicates between switches on the network using Bridge Protocol Data Units (BPDUs). Each BPDU contains the following information:

- The unique identifier of the switch that the transmitting switch currently believes is the root switch
- The path cost to the root from the transmitting port
- The port identifier of the transmitting port

The switch sends BPDUs to communicate and construct the spanning-tree topology. All switches connected to the LAN on which the packet is transmitted will receive the BPDU. BPDUs are not directly forwarded by the switch, but the receiving switch uses the information in the frame to calculate a BPDU, and, if the topology changes, initiates a BPDU transmission.

The communication between switches via BPDUs results in the following:

- One switch is elected as the root switch
- The shortest distance to the root switch is calculated for each switch
- A designated switch is selected. This is the switch closest to the root switch through which packets will be forwarded to the root.
- A port for each switch is selected. This is the port providing the best path from the switch to the root switch.
- Ports included in the STP are selected.

Creating a Stable STP Topology

It is to make the root port a fastest link. If all switches have STP enabled with default settings, the switch with the lowest MAC address in the network will become the root switch. By increasing the priority (lowering the priority number) of the best switch, STP can be forced to select the best switch as the root switch.

When STP is enabled using the default parameters, the path between source and destination stations in a switched network might not be ideal. For instance, connecting higher-speed links to a port that has a higher number than the current root port can cause a root-port change.

STP Port States

The BPDUs take some time to pass through a network. This propagation delay can result in topology changes where a port that transitioned directly from a Blocking state to a Forwarding state could create temporary data loops. Ports must wait for new network topology information to propagate throughout the network before starting to forward packets. They must also wait for the packet lifetime to expire for BPDU packets that were forwarded based on the old topology. The forward delay timer is used to allow the network topology to stabilize after a topology change. In addition, STP specifies a series of states a port must transition through to further ensure that a stable network topology is created after a topology change.

Each port on a switch using STP exists in one of the following five states:

- **Blocking** – the port is blocked from forwarding or receiving packets
- **Listening** – the port is waiting to receive BPDU packets that may tell the port to go back to the blocking state
- **Learning** – the port is adding addresses to its forwarding database, but not yet forwarding packets
- **Forwarding** – the port is forwarding packets
- **Disabled** – the port only responds to network management messages and must return to the blocking state first

A port transitions from one state to another as follows:

- From initialization (switch boot) to blocking
- From blocking to listening or to disabled
- From listening to learning or to disabled
- From learning to forwarding or to disabled
- From forwarding to disabled
- From disabled to blocking

Figure 4-3-54: STP Port State Transitions

You can modify each port state by using management software. When you enable STP, every port on every switch in the network goes through the blocking state and then transitions through the states of listening and learning at power up. If properly configured, each port stabilizes to the forwarding or blocking state. No packets (except BPDUs) are forwarded from, or received by, STP enabled ports until the forwarding state is enabled for that port.

2. STP Parameters

STP Operation Levels

The Switch allows for two levels of operation: the switch level and the port level. The switch level forms a spanning tree consisting of links between one or more switches. The port level constructs a spanning tree consisting of groups of one or more ports. The STP operates in much the same way for both levels.

On the switch level, STP calculates the Bridge Identifier for each switch and then sets the Root Bridge and the Designated Bridges. On the port level, STP sets the Root Port and the Designated Ports.

The following are the user-configurable STP parameters for the switch level:

Parameter	Description	Default Value
Bridge Identifier(Not user configurable except by setting priority below)	A combination of the User-set priority and the switch's MAC address. The Bridge Identifier consists of two parts: a 16-bit priority and a 48-bit Ethernet MAC address 32768 + MAC	32768 + MAC
Priority	A relative priority for each switch – lower numbers give a higher priority and a greater chance of a given switch being elected as the root bridge	32768
Hello Time	The length of time between broadcasts of the hello message by the switch	2 seconds
Maximum Age Timer	Measures the age of a received BPDU for a port and ensures that the BPDU is discarded when its age exceeds the value of the maximum age timer.	20 seconds
Forward Delay Timer	The amount time spent by a port in the learning and listening states waiting for a BPDU that may return the port to the blocking state.	15 seconds

The following are the user-configurable STP parameters for the port or port group level:

Variable	Description	Default Value
Port Priority	A relative priority for each port –lower numbers give a higher priority and a greater chance of a given port being elected as the root port	128
Port Cost	A value used by STP to evaluate paths – STP calculates path costs and selects the path with the minimum cost as the active path	200,000-100Mbps Fast Ethernet ports 20,000-1000Mbps Gigabit Ethernet ports 0 - Auto

Default Spanning-Tree Configuration

Feature	Default Value
Enable state	STP disabled for all ports
Port priority	128
Port cost	0
Bridge Priority	32,768

User-Changeable STA Parameters

The Switch's factory default setting should cover the majority of installations. However, it is advisable to keep the default settings as set at the factory; unless, it is absolutely necessary. The user changeable parameters in the Switch are as follows:

Priority – A Priority for the switch can be set from 0 to 65535. 0 is equal to the highest Priority.

Hello Time – The Hello Time can be from 1 to 10 seconds. This is the interval between two transmissions of BPDU packets sent by the Root Bridge to tell all other Switches that it is indeed the Root Bridge. If you set a Hello Time for your Switch, and it is not the Root Bridge, the set Hello Time will be used if and when your Switch becomes the Root Bridge.

The Hello Time cannot be longer than the Max. Age. Otherwise, a configuration error will occur.

Max. Age – The Max Age can be from 6 to 40 seconds. At the end of the Max Age, if a BPDU has still not been received from the Root Bridge, your Switch will start sending its own BPDU to all other Switches for permission to become the Root Bridge. If it turns out that your Switch has the lowest Bridge Identifier, it will become the Root Bridge.

Forward Delay Timer – The Forward Delay can be from 4 to 30 seconds. This is the time any port on the Switch spends in the listening state while moving from the blocking state to the forwarding state.

Observe the following formulas when setting the above parameters:

Max. Age _ 2 x (Forward Delay - 1 second)

Max. Age _ 2 x (Hello Time + 1 second)

Port Priority – A Port Priority can be from 0 to 240. The lower the number, the greater the probability the port will be chosen as the Root Port.

Port Cost – A Port Cost can be set from 0 to 200000000. The lower the number, the greater the probability the port will be chosen to forward packets.

3. Illustration of STP

A simple illustration of three switches connected in a loop is depicted in the below diagram. In this example, you can anticipate some major network problems if the STP assistance is not applied.

If switch A broadcasts a packet to switch B, switch B will broadcast it to switch C, and switch C will broadcast it to back to switch A and so on. The broadcast packet will be passed indefinitely in a loop, potentially causing a network failure. In this example, STP breaks the loop by blocking the connection between switch B and C. The decision to block a particular connection is based on the STP calculation of the most current Bridge and Port settings.

Now, if switch A broadcasts a packet to switch C, then switch C will drop the packet at port 2 and the broadcast will end there. Setting-up STP using values other than the defaults, can be complex. Therefore, you are advised to keep the default factory settings and STP will automatically assign root bridges/ports and block loop connections. Influencing STP to choose a particular switch as the root bridge using the Priority setting, or influencing STP to choose a particular port to block using the Port Priority and Port Cost settings is, however, relatively straight forward.

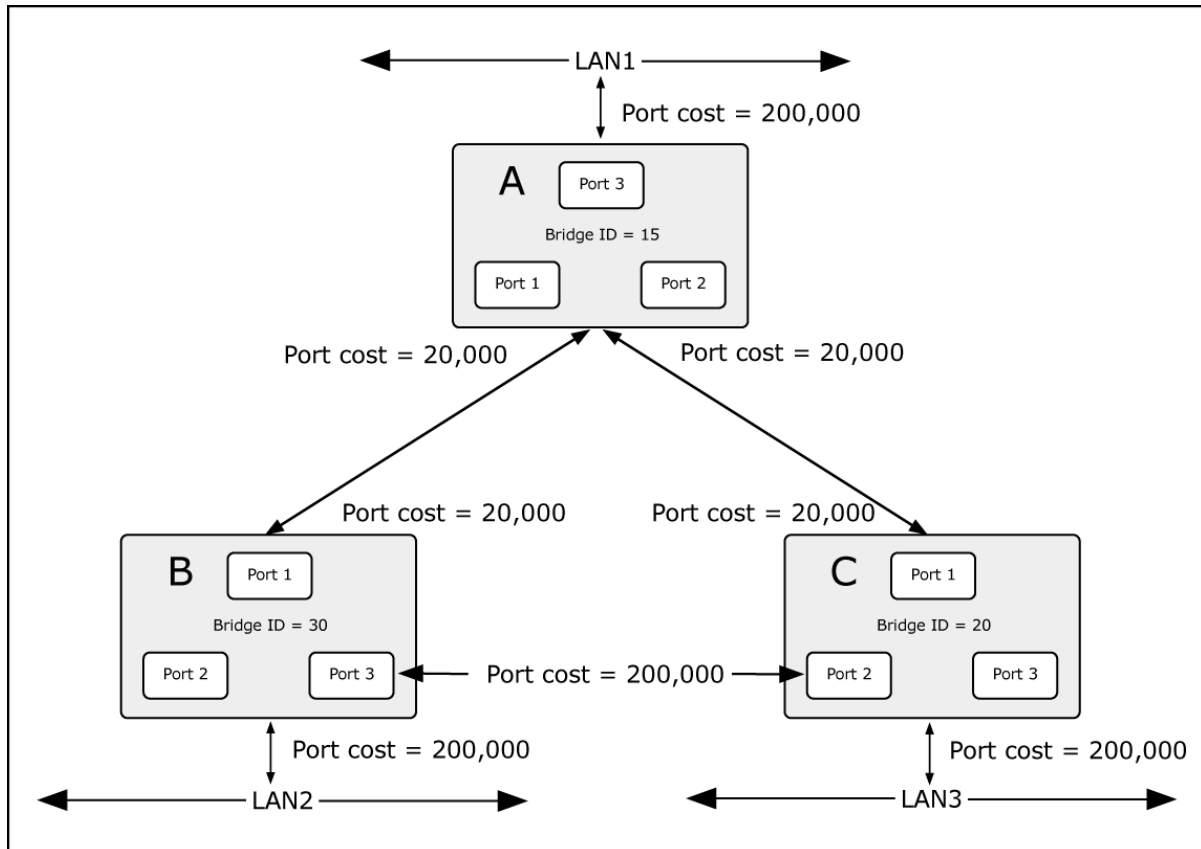

Figure 4-3-55: Before Applying the STA Rules

In this example, only the default STP values are used.

Figure 4-3-56: After Applying the STA Rules

The switch with the lowest Bridge ID (switch C) was elected the root bridge, and the ports were selected to give a high port cost between switches B and C. The two (optional) Gigabit ports (default port cost = 20,000) on switch A are connected to one (optional) Gigabit port on both switch B and C. The redundant link between switch B and C is deliberately chosen as a 100 Mbps Fast Ethernet link (default port cost = 200,000). Gigabit ports could be used, but the port cost should be increased from the default to ensure that the link between switch B and switch C is the blocked link.

4.3.4.2 STP Global Settings

This page allows you to configure STP system settings. The settings are used by all STP Bridge instances in the Switch. The Managed Switch support the following Spanning Tree protocols:

- **Compatible -- Spanning Tree Protocol (STP):** Provides a single path between end stations, avoiding and eliminating loops.
- **Normal -- Rapid Spanning Tree Protocol (RSTP):** Detects and uses of network topologies that provide faster spanning tree convergence, without creating forwarding loops.
- **Extension -- Multiple Spanning Tree Protocol (MSTP):** Defines an extension to RSTP to further develop the usefulness of virtual LANs (VLANs). This "Per-VLAN" Multiple Spanning Tree Protocol configures a separate Spanning Tree for each VLAN group and blocks all but one of the possible alternate paths within each Spanning Tree.

The STP Global Settings screens in [Figure 4-3-57](#) & [Figure 4-3-58](#) appear.

Figure 4-3-64: CIST Port Status Page Screenshot

The page includes the following fields:

Object	Description
• Port	The switch port number of the logical STP port.
• Identifier (Priority / Port ID)	Display the current identifier (Priority / Port ID).
• External Path Cost Conf/Oper	Display the current external path cost conf/oper.
• Internal Path Cost Conf/Oper	Display the current internal path cost/oper.
• Designated Root Bridge	Display the current designated root bridge.
• External Root Cost	Display the current external root cost.
• Regional Root Bridge	Display the current regional root bridge.
• Internal Root Cost	Display the current internal root cost.
• Designated Bridge	Display the current designated bridge.
• Internal Port Path Cost	Display the current internal port path cost.
• Edge Port Conf/Oper	Display the current edge port conf/oper.
• P2P MAC Conf/Oper	Display the current P2P MAC conf/oper.
• Port Role	Display the current port role.
• Port State	Display the current port state.

4.3.4.6 MST Instance Configuration

This page allows the user to configure MST Instance Configuration. The MST Instance Setting, Information and Status screens in [Figure 4-3-65](#), [Figure 4-3-66](#) & [Figure 4-3-67](#) appear.

MSTI ID (1-15)	VLAN List (1-4094)	Priority
1		32768

Apply

Figure 4-3-65: MST Instance Setting Page Screenshot

The page includes the following fields:

Object	Description
• MSTI ID	Allow to assign MSTI ID. The range for the MSTI ID is 1-15.
• VLAN List (1-4096)	Allow to assign VLAN list to special MSTI ID. The range for the VLAN list is 1-4094.
• Priority	Controls the bridge priority. Lower numerical values have better priority. The bridge priority plus the MSTI instance number, concatenated with the 6-byte MAC address of the switch forms a Bridge Identifier.

Buttons

Apply: Click to apply changes.

MST Instance Setting Information				
MSTI	Status	VLAN List	VLAN Count	Priority

Figure 4-3-66: MSTI Instance Setting Information Page Screenshot

The page includes the following fields:

Object	Description
• MSTI	Display the current MSTI entry.
• Status	Display the current MSTI status.
• VLAN List	Display the current VLAN list.
• VLAN Count	Display the current VLAN count.
• Priority	Display the current MSTI priority.

4.3.4.7 MST Port Setting

This page allows the user to inspect the current STP MSTI port configurations, and possibly change them as well.

A MSTI port is a virtual port, which is instantiated separately for each active CIST (physical) port for each MSTI instance configured and applicable for the port. The MSTI instance must be selected before displaying actual MSTI port configuration options.

This page contains MSTI port settings for physical and aggregated ports. The aggregation settings are global. The MSTI Ports Setting screens in [Figure 4-3-68](#) & [Figure 4-3-69](#) appear.

MST ID	Port Select	Priority	Internal Path Cost (0 = Auto)
1	Select Ports	128	0

Apply

Figure 4-3-68: MST Port Configuration Page Screenshot

The page includes the following fields:

Object	Description
• MST ID	Enter the special MST ID to configure path cost & priority.
• Port Select	Select port number for this drop down list.
• Priority	Controls the port priority. This can be used to control priority of ports having identical port cost.
• Internal Path Cost (0 = Auto)	<p>Controls the path cost incurred by the port.</p> <p>The Auto setting will set the path cost as appropriate by the physical link speed, using the 802.1D recommended values. Using the Specific setting, a user-defined value can be entered.</p> <p>The path cost is used when establishing the active topology of the network. Lower path cost ports are chosen as forwarding ports in favor of higher path cost ports.</p> <p>Valid values are in the range 1 to 200000000.</p>

Forwarding Method For IPv4	MAC
Forwarding Method For IPv6	MAC

Figure 4-3-72: Properties Information Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Unknown Multicast Action 	Display the current unknown multicast action status.
<ul style="list-style-type: none"> Forward Method For IPv4 	Display the current IPv4 multicast forward method.
<ul style="list-style-type: none"> Forward Method For IPv6 	Display the current IPv6 multicast forward method.

4.3.5.2 Multicast Throttling Setting

Multicast throttling sets a maximum number of multicast groups that a port can join at the same time. When the maximum number of groups is reached on a port, the switch can take one of two actions; either “deny” or “replace”. If the action is set to deny, any new multicast join reports will be dropped. If the action is set to replace, the switch randomly removes an existing group and replaces it with the new multicast group.

Once you have configured multicast profiles, you can assign them to interfaces on the Managed Switch. Also you can set the multicast throttling number to limit the number of multicast groups an interface can join at the same time. The MAX Group and Information screens in [Figure 4-3-73](#) & [Figure 4-3-74](#) appear.

IP Type	Port Select	Max Groups	Action
ipv4	Select Ports	256 (0-256)	<input checked="" type="radio"/> Deny <input type="radio"/> Replace

Apply

Figure 4-3-73: Max Groups and Action Setting Page Screenshot

The page includes the following fields:

Object	Description
• IP Type	Select IPv4 or IPv6 for this drop down list.
• Port Select	Select port number for this drop down list.
• Max Groups	Sets the maximum number of multicast groups an interface can join at the same time. Range: 0-256; Default: 256
• Action	Sets the action to take when the maximum number of multicast groups for the interface has been exceeded. (Default: Deny) - Deny - The new multicast group join report is dropped. - Replace - The new multicast group replaces an existing group.

Buttons

: Click to apply changes.

• Max Groups	Display the current Max groups.
• Action	Display the current action.

4.3.5.3 Multicast Profile Setting

In certain switch applications, the administrator may want to control the multicast services that are available to end users. For example, an IP/TV service is based on a specific subscription plan. The multicast filtering feature fulfills this requirement by restricting access to specified multicast services on a switch port.

Multicast filtering enables you to assign a profile to a switch port that specifies multicast groups that are permitted or denied on the port. A multicast filter profile can contain one or more, or a range of multicast addresses; but only one profile can be assigned to a port. When enabled, multicast join reports received on the port are checked against the filter profile. If a requested multicast group is permitted, the multicast join report is forwarded as normal. If a requested multicast group is denied, the multicast join report is dropped.

When you have created a Multicast profile number, you can then configure the multicast groups to filter and set the access mode.

Command Usage

- Each profile has only one access mode; either **permit** or **deny**.
- When the access mode is set to **permit**, multicast join reports are processed when a multicast group falls within the controlled range.
- When the access mode is set to **deny**, multicast join reports are only processed when the multicast group is not in the controlled range.

The Add Profile and Profile Status screens in [Figure 4-3-75](#) & [Figure 4-3-76](#) appear.

Add Profile	
Ip Type	ipv4
Profile Index	1 (1-128)
Group from	
Group to	
Action	<input checked="" type="radio"/> Permit <input type="radio"/> Deny

Add

Figure 4-3-75: Add Profile Setting Page Screenshot

The page includes the following fields:

Object	Description	
• IP Type	Select IPv4 or IPv6 for this drop down list.	
• Profile Index	Indicates the ID of this particular profile.	
• Group from	Specifies multicast groups to include in the profile. Specify a multicast group range by entering a start IP address.	
• Group to	Specifies multicast groups to include in the profile. Specify a multicast group range by entering an end IP address.	
• Action	Sets the access mode of the profile; either permit or deny .	
	- Permit	Multicast join reports are processed when a multicast group falls within the controlled range.
	- Deny	When the access mode is set to, multicast join reports are only processed when the multicast group is not in the controlled range.

Buttons

: Click to add multicast profile entry.

Figure 4-3-76: IGMP/MLD Profile Status Page Screenshot

The page includes the following fields:

Object	Description	
• Index	Display the current index.	
• IP Type	Display the current IP Type.	
• Group from	Display the current group from.	
• Group to	Display the current group to.	
• Action	Display the current action.	
• Modify	Click  to edit parameter.	
	Click  to delete the MLD/IGMP profile entry.	

4.3.6 IGMP Snooping

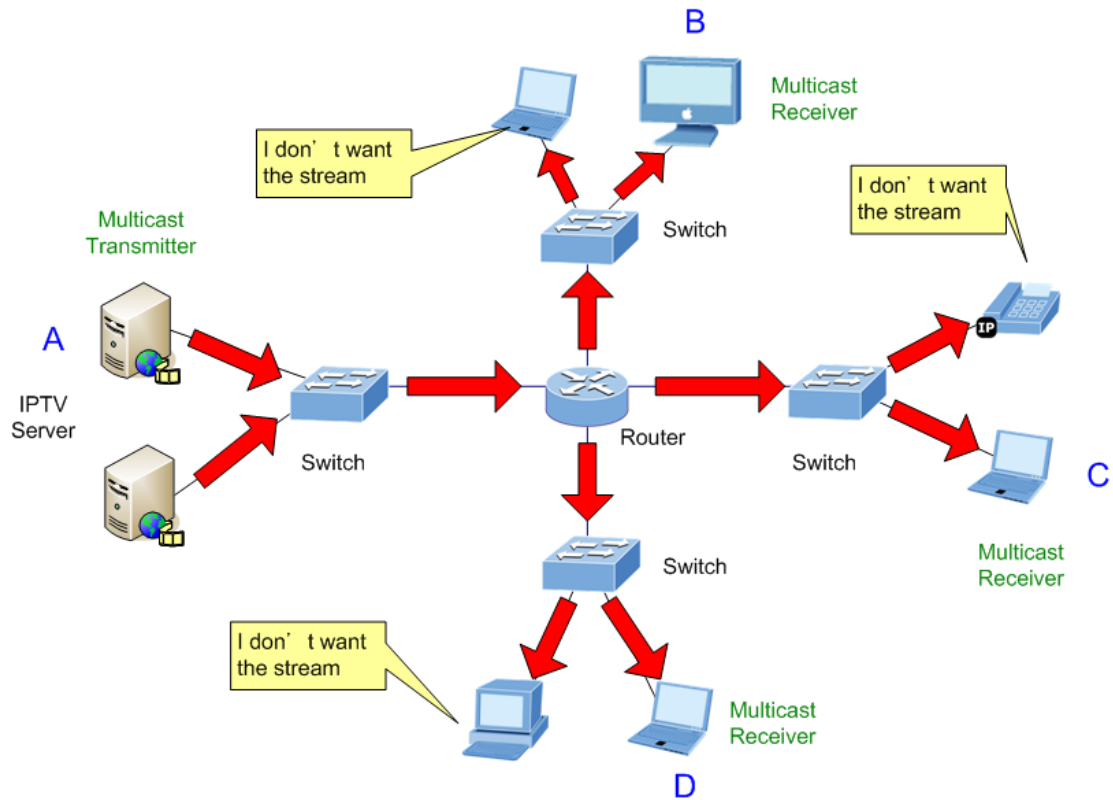

The **Internet Group Management Protocol (IGMP)** lets host and routers share information about multicast group memberships. IGMP snooping is a switch feature that monitors the exchange of IGMP messages and copies them to the CPU for feature processing. The overall purpose of IGMP Snooping is to limit the forwarding of multicast frames to only ports that are a member of the multicast group.

About the Internet Group Management Protocol (IGMP) Snooping

Computers and network devices that want to receive multicast transmissions need to inform nearby routers that they will become members of a multicast group. The **Internet Group Management Protocol (IGMP)** is used to communicate this information. IGMP is also used to periodically check the multicast group for members that are no longer active. In the case where there is more than one multicast router on a sub network, one router is elected as the 'queried'. This router then keeps track of the membership of the multicast groups that have active members. The information received from IGMP is then used to determine if multicast packets should be forwarded to a given sub network or not. The router can check, using IGMP, to see if there is at least one member of a multicast group on a given subnet work. If there are no members on a sub network, packets will not be forwarded to that sub network.

Multicast Service

Multicast Flooding

IGMP Snooping Multicast Stream Control

IGMP Versions 1 and 2

Multicast groups allow members to join or leave at any time. IGMP provides the method for members and multicast routers to communicate when joining or leaving a multicast group.

IGMP version 1 is defined in RFC 1112. It has a fixed packet size and no optional data.

The format of an IGMP packet is shown below:

IGMP Message Format

The IGMP Type codes are shown below:

Type	Meaning
0x11	Membership Query (if Group Address is 0.0.0.0)
0x11	Specific Group Membership Query (if Group Address is Present)
0x16	Membership Report (version 2)
0x17	Leave a Group (version 2)
0x12	Membership Report (version 1)

IGMP packets enable multicast routers to keep track of the membership of multicast groups, on their respective sub networks.

The following outlines what is communicated between a multicast router and a multicast group member using IGMP.

A host sends an IGMP “**report**” to join a group

A host will never send a report when it wants to leave a group (for version 1).

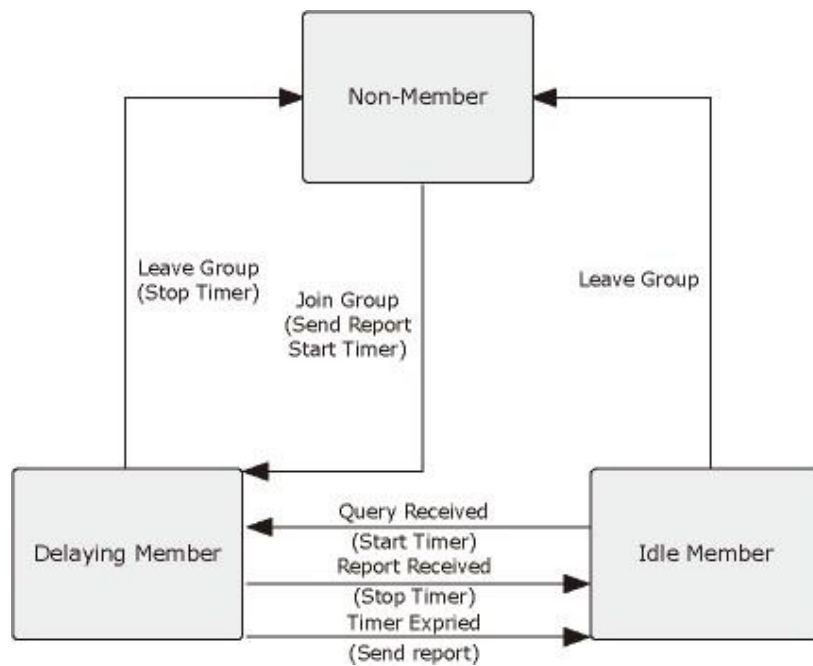

A host will send a “**leave**” report when it wants to leave a group (for version 2).

Multicast routers send IGMP queries (to the all-hosts group address: 224.0.0.1) periodically to see whether any group members exist on their sub networks. If there is no response from a particular group, the router assumes that there are no group members on the network.

The Time-to-Live (TTL) field of query messages is set to 1 so that the queries will not be forwarded to other sub networks.

IGMP version 2 introduces some enhancements such as a method to elect a multicast queried for each LAN, an explicit leave message, and query messages that are specific to a given group.

The states a computer will go through to join or to leave a multicast group are shown below:

IGMP State Transitions

■ IGMP Querier –

A router, or multicast-enabled switch, can periodically ask their hosts if they want to receive multicast traffic. If there is more than one router/switch on the LAN performing IP multicasting, one of these devices is elected “**querier**” and assumes the role of querying the LAN for group members. It then propagates the service requests on to any upstream multicast switch/router to ensure that it will continue to receive the multicast service.

Note

Multicast routers use this information, along with a multicast routing protocol such as DVMRP or PIM, to support IP multicasting across the Internet.

4.3.6.1 IGMP Setting

This page provides IGMP Snooping related configuration.

Most of the settings are global, whereas the Router Port configuration is related to the current unit, as reflected by the page header. The IGMP Snooping Setting and Information screens in [Figure 4-3-77](#), [Figure 4-3-78](#) & [Figure 4-3-79](#) appear.

IGMP Snooping	
IGMP Snooping Status	<input checked="" type="radio"/> Enable <input type="radio"/> Disable

The page includes the following fields:

Object	Description
• Entry No.	Display the current entry number.
• VLAN ID	Display the current VLAN ID.
• IGMP Snooping Operation Status	Display the current IGMP snooping operation status.
• Router Ports Auto Learn	Display the current router ports auto learning.
• Query Robustness	Display the current query robustness.
• Query Interval (sec.)	Display the current query interval.
• Query Max Response Interval (sec.)	Display the current query max response interval.
• Last Member Query count	Display the current last member query count.
• Last Member Query Interval (sec)	Display the current last member query interval.
• Immediate Leave	Display the current immediate leave.
• Modify	Click Edit to edit parameter.

4.3.6.2 IGMP Querier Setting

This page provides IGMP Querier Setting. The IGMP Querier Setting screens in [Figure 4-3-80](#) & [Figure 4-3-81](#) appear.

Figure 4-3-80: IGMP VLAN Setting Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Select VLAN ID for this drop down list.
• Querier State	Enable or disable the querier state. The default value is "Disabled".
• Querier Version	Sets the querier version for compatibility with other devices on the network. Version: 2 or 3; Default: 2

Buttons

Apply: Click to apply changes.

Figure 4-3-81: IGMP Querier Status Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Display the current VLAN ID.
• Querier State	Display the current querier state.
• Querier Status	Display the current querier status.
• Querier Version	Display the current querier version.
• Querier IP	Display the current querier IP.

4.3.6.3 IGMP Static Group

Multicast filtering can be dynamically configured using IGMP Snooping and IGMP Query messages as described in above sections. For certain applications that require tighter control, you may need to statically configure a multicast service on the Managed Switch. First add all the ports attached to participating hosts to a common VLAN, and then assign the multicast service to that VLAN group.

- Static multicast addresses are never aged out.
- When a multicast address is assigned to an interface in a specific VLAN, the corresponding traffic can only be forwarded to ports within that VLAN.

The IGMP Static Group configuration screens in [Figure 4-3-82](#) & [Figure 4-3-83](#) appear.

Figure 4-3-82: Add IGMP Static Group Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Select VLAN ID for this drop down list
• Group IP Address	The IP address for a specific multicast service
• Member Ports	Select port number for this drop down list

Buttons

Add: Click to add IGMP router port entry.

Object	Description
• VLAN ID	Display the current VLAN ID.
• Group IP Address	Display the current group IP address.
• Member Ports	Display the current member ports.
• Modify	Click Edit to edit parameter

4.3.6.4 IGMP Group Table

This page provides Multicast Database. The IGMP Group Table screen in [Figure 4-3-84](#) appears.

Figure 4-3-84: IGMP Group Table Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Display the current VID.
• Group IP Address	Display multicast IP address for a specific multicast service.
• Member Port	Display the current member port.
• Type	Member types displayed include Static or Dynamic, depending on selected options.
• Life(Sec)	Display the current life.

4.3.6.5 IGMP Router Setting

Depending on your network connections, IGMP snooping may not always be able to locate the IGMP querier. Therefore, if the IGMP querier is a known multicast router/ switch connected over the network to an interface (port or trunk) on your Managed Switch, you can manually configure the interface (and a specified VLAN) to join all the current multicast groups supported by the attached router. This can ensure that multicast traffic is passed to all the appropriate interfaces within the Managed Switch. The IGMP Router Setting and Status screens in [Figure 4-3-85](#) & [Figure 4-3-86](#) appear.

Figure 4-3-85: Add Router Port Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Selects the VLAN to propagate all multicast traffic coming from the attached multicast router.
• Type	Sets the Router port type. The types of Router port as below: <ul style="list-style-type: none"> ■ Static ■ Forbid
• Static Ports Select	Specify which ports act as router ports. A router port is a port on the Ethernet switch that leads towards the Layer 3 multicast device or IGMP querier.
• Forbid Port Select	Specify which ports un-act as router ports

Buttons

Add: Click to add IGMP router port entry.

Figure 4-3-86: Router Port Status Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Display the current VLAN ID.
• Static Ports	Display the current static ports.
• Forbidden Ports	Display the current forbidden ports.
• Modify	Click Edit to edit parameter. Click Delete to delete the group ID entry.

4.3.6.6 IGMP Router Table

This page provides Router Table. The Dynamic, Static and Forbidden Router Table screens in [Figure 4-3-87](#), [Figure 4-3-88](#) & [Figure 4-3-89](#) appear.

Figure 4-3-87: Dynamic Router Table Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Display the current VLAN ID.
• Port	Display the current dynamic router ports.
• Expiry Time (Sec)	Display the current expiry time.

Figure 4-3-88: Static Router Table Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Display the current VLAN ID.
• Port Mask	Display the current port mask.

Refresh

: Click to refresh the IGMP Snooping Statistics.

4.3.6.9 IGMP Filter Setting

The Filter Setting and Status screens in [Figure 4-3-92](#) & [Figure 4-3-93](#) appear.

Figure 4-3-92: Filter Setting Page Screenshot

The page includes the following fields:

Object	Description
• Port Select	Select port number for this drop down list.
• Filter Profile ID	Select filter profile ID for this drop down list.

Buttons

: Click to apply changes.

Figure 4-3-93: Port Filter Status Page Screenshot

The page includes the following fields:

Object	Description
• Port	Display the current port.
• Filter Profile ID	Display the current filter profile ID.
• Action	<p>Click  to display detail profile parameter.</p> <p>Click  to delete the IGMP filter profile entry.</p>

4.3.7 MLD Snooping

4.3.7.1 MLD Setting

This page provides MLD Snooping related configuration.

Most of the settings are global, whereas the Router Port configuration is related to the current unit, as reflected by the page header. The MLD Snooping Setting, Information and Table screens in [Figure 4-3-94](#), [Figure 4-3-95](#) & [Figure 4-3-96](#) appear.

MLD Snooping	
MLD Snooping Status	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
MLD Snooping Version	<input checked="" type="radio"/> v1 <input type="radio"/> v2
MLD Snooping Report Suppression	<input checked="" type="radio"/> Enable <input type="radio"/> Disable

Apply

Figure 4-3-94: MLD Snooping Page Screenshot

The page includes the following fields:

Object	Description
• MLD Snooping Status	Enable or disable the MLD snooping. The default value is "Disabled".
• MLD Snooping Version	Sets the MLD Snooping operation version. Possible versions are: <div> <input checked="" type="radio"/> v1: Set MLD Snooping supported MLD version 1. <input type="radio"/> v2: Set MLD Snooping supported MLD version 2. </div>
• MLD Snooping Report Suppression	Limits the membership report traffic sent to multicast-capable routers. When you disable report suppression, all MLD reports are sent as is to multicast-capable routers. The default is enabled.

Buttons

Apply: Click to apply changes.

MLD Snooping Informations	
Information Name	Information Value
MLD Snooping Status	Disable
MLD Snooping Version	v1
MLD Snooping V2 Report Suppression	Enable

Figure 4-3-95: MLD Snooping information Page Screenshot

The page includes the following fields:

Object	Description
• MLD Snooping Status	Display the current MLD snooping status.
• MLD Snooping Version	Display the current MLD snooping version.
• MLD Snooping Report Suppression	Display the current MLD snooping report suppression.

MLD Snooping Table

Figure 4-3-96: MLD Snooping Table Page Screenshot

The page includes the following fields:

Object	Description
• Entry No.	Display the current entry number.
• VLAN ID	Display the current VLAN ID.
• MLD Snooping Operation Status	Display the current MLD snooping operation status.
• Router Ports Auto Learn	Display the current router ports auto learning.
• Query Robustness	Display the current query robustness.
• Query Interval (sec.)	Display the current query interval.
• Query Max Response Interval (sec.)	Display the current query max response interval.
• Last Member Query count	Display the current last member query count.
• Last Member Query Interval (sec)	Display the current last member query interval.
• Immediate Leave	Display the current immediate leave.
• Modify	Click Edit to edit parameter.

4.3.7.2 MLD Static Group

The MLD Static Group configuration screens in [Figure 4-3-97](#) & [Figure 4-3-98](#) appear.

VLAN ID	Group IP Address	Member Ports
Select VLANs	::	Select Ports

Add

Figure 4-3-97: Add MLD Static Group Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Select VLAN ID for this drop down list.
• Group IP Address	The IP address for a specific multicast service.
• Member Ports	Select port number for this drop down list.

Buttons

Add: Click to add IGMP router port entry.

VLAN ID	Group IPv6 Address	Member Ports	Modify
---------	--------------------	--------------	--------

Figure 4-3-98: MLD Static Groups Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Display the current VLAN ID.
• Group IPv6 Address	Display the current group IPv6 address.
• Member Ports	Display the current member ports.
• Modify	Click Edit to edit parameter..

4.3.7.3 MLD Group Table

This page provides MLD Group Table. The MLD Group Table screen in [Figure 4-3-99](#) appears.

The screenshot shows a web interface titled "MLD Group Table". Below the title is a table with five columns: "VLAN ID", "Group IP Address", "Member Ports", "Type", and "Life(Sec)". The table is currently empty.

Figure 4-3-99: MLD Group Table Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Display the current VID.
• Group IP Address	Display multicast IP address for a specific multicast service.
• Member Port	Display the current member port.
• Type	Member types displayed include Static or Dynamic, depending on selected options.
• Life(Sec)	Display the current life.

4.3.7.4 MLD Router Setting

Depending on your network connections, MLD snooping may not always be able to locate the MLD querier. Therefore, if the MLD querier is a known multicast router/ switch connected over the network to an interface (port or trunk) on your Managed Switch, you can manually configure the interface (and a specified VLAN) to join all the current multicast groups supported by the attached router. This can ensure that multicast traffic is passed to all the appropriate interfaces within the Managed Switch. The MLD Router Setting screens in [Figure 4-3-100](#) & [Figure 4-3-101](#) appear.

Figure 4-3-100: Add Router Port Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Selects the VLAN to propagate all multicast traffic coming from the attached multicast router
• Type	Sets the Router port type. The types of Router port as below: Static Forbid
• Static Ports Select	Specify which ports act as router ports. A router port is a port on the Ethernet switch that leads towards the Layer 3 multicast device or MLD querier.
• Forbid Port Select	Specify which ports un-act as router ports

Buttons

Add: Click to add MLD router port entry.

Figure 4-3-101: Router Port Status Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Display the current VLAN ID.
• Static Ports	Display the current static ports.
• Forbidden Ports	Display the current forbidden ports.
• Modify	Click Edit to edit parameter. Click Delete to delete the group ID entry.

4.3.7.5 MLD Router Table

This page provides Router Table. The Dynamic, Static and Forbidden Router Table screens in [Figure 4-3-102](#), [Figure 4-3-103](#) & [Figure 4-3-104](#) appear.

Figure 4-3-102: Dynamic Router Table Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Display the current VLAN ID.
• Port	Display the current dynamic router ports.
• Expiry Time (Sec)	Display the current expiry time.

Figure 4-3-103: Static Router Table Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Display the current VLAN ID.
• Port Mask	Display the current port mask.

Figure 4-3-104: Forbidden Router Table Page Screenshot

The page includes the following fields:

Object	Description
• VLAN ID	Display the current VLAN ID
• Port Mask	Display the current port mask

4.3.7.6 MLD Forward All

This page provides MLD Forward All. The Forward All screen in [Figure 4-3-105](#) appears.

Forward All

VLAN ID :

Port	Membership
GE1	<input type="radio"/> Static <input type="radio"/> Forbidden <input checked="" type="radio"/> None

: Click to clear the MLD Snooping Statistics.

Refresh

: Click to refresh the MLD Snooping Statistics.

4.3.7.8 MLD Filter Setting

The Filter Setting and Status screens in [Figure 4-3-107](#) & [Figure 4-3-108](#) appear.

Figure 4-3-107: Filter Setting Page Screenshot

The page includes the following fields:

Object	Description
• Port Select	Select port number for this drop down list.
• Filter Profile ID	Select filter profile ID for this drop down list.

Buttons

: Click to apply changes.

Figure 4-3-108: Port Filter Status Page Screenshot

The page includes the following fields:

Object	Description
• Port	Display the current port.
• Filter Profile ID	Display the current filter profile ID.
• Action	<p>Click  to display detail profile parameter.</p> <p>Click  to delete the MLD filter profile entry.</p>

4.3.8 LLDP

4.3.8.1 Link Layer Discovery Protocol

Link Layer Discovery Protocol (LLDP) is used to discover basic information about neighboring devices on the local broadcast domain. LLDP is a Layer 2 protocol that uses periodic broadcasts to advertise information about the sending device. Advertised information is represented in **Type Length Value (TLV)** format according to the IEEE 802.1ab standard, and can include details such as device identification, capabilities and configuration settings. LLDP also defines how to store and maintain information gathered about the neighboring network nodes it discovers.

Link Layer Discovery Protocol - Media Endpoint Discovery (LLDP-MED) is an extension of LLDP intended for managing endpoint devices such as Voice over IP phones and network switches. The LLDP-MED TLVs advertise information such as network policy, power, inventory, and device location details. LLDP and LLDP-MED information can be used by SNMP applications to simplify troubleshooting, enhance network management, and maintain an accurate network topology.

4.3.8.2 LLDP Global Setting

This Page allows the user to inspect and configure the current LLDP port settings. The LLDP Global Setting and Config screens in [Figure 4-3-109](#) & [Figure 4-3-110](#) appear.

Global Settings	
Enabled	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled
LLDP PDU Disable Action	<input type="radio"/> Filtering <input type="radio"/> Bridging <input checked="" type="radio"/> Flooding
Transmission Interval	30 (5-32768)
Holdtime Multiplier	4 (2-10)
Reinitialization Delay	2 (1-10)
Transmit Delay	2 (1-8192)
LLDP-MED Fast Start Repeat Count	3 (1-10)

Apply

Figure 4-3-109: Global Setting Page Screenshot

The page includes the following fields:

Object	Description
• Enable	Globally enable or disable LLDP function
• LLDP PDU Disable Action	Set LLDP PDU disable action: include "Filtering", "Bridging" and "Flooding". <ul style="list-style-type: none"> ■ Filtering: discard all LLDP PDU. ■ Bridging: transmit LLDP PDU in the same VLAN.

	<p>■ Flooding: transmit LLDP PDU for all port.</p>
<ul style="list-style-type: none"> • Transmission Interval 	<p>The switch is periodically transmitting LLDP frames to its neighbors for having the network discovery information up-to-date. The interval between each LLDP frame is determined by the Transmission Interval value. Valid values are restricted to 5 - 32768 seconds.</p> <p>Default: 30 seconds</p> <p>This attribute must comply with the following rule:</p> <p>$(\text{Transmission Interval} * \text{Hold Time Multiplier}) \leq 65536$, and $\text{Transmission Interval} \geq (4 * \text{Delay Interval})$</p>
<ul style="list-style-type: none"> • Holdtime Multiplier 	<p>Each LLDP frame contains information about how long the information in the LLDP frame shall be considered valid. The LLDP information valid period is set to Holdtime multiplied by Transmission Interval seconds. Valid values are restricted to 2 - 10 times.</p> <p>TTL in seconds is based on the following rule:</p> <p>$(\text{Transmission Interval} * \text{Holdtime Multiplier}) \leq 65536$.</p> <p>Therefore, the default TTL is $4 * 30 = 120$ seconds.</p>
<ul style="list-style-type: none"> • Reinitialization Delay 	<p>When a port is disabled, LLDP is disabled or the switch is rebooted a LLDP shutdown frame is transmitted to the neighboring units, signaling that the LLDP information isn't valid anymore. Tx Reinit controls the amount of seconds between the shutdown frame and a new LLDP initialization. Valid values are restricted to 1 - 10 seconds.</p>
<ul style="list-style-type: none"> • Transmit Delay 	<p>If some configuration is changed (e.g. the IP address) a new LLDP frame is transmitted, but the time between the LLDP frames will always be at least the value of Transmit Delay seconds. Transmit Delay cannot be larger than 1/4 of the Transmission Interval value. Valid values are restricted to 1 - 8192 seconds.</p> <p>This attribute must comply with the rule:</p> <p>$(4 * \text{Delay Interval}) \leq \text{Transmission Interval}$</p>
<ul style="list-style-type: none"> • LLDP-MED Fast Start Repeat Count 	<p>Configures the amount of LLDP MED Fast Start LLDPDUs to transmit during the activation process of the LLDP-MED Fast Start mechanism.</p> <p>Range: 1-10 packets;</p> <p>Default: 3 packets</p> <p>The MED Fast Start Count parameter is part of the timer which ensures that the LLDP-MED Fast Start mechanism is active for the port. LLDP-MED Fast Start is critical to the timely startup of LLDP, and therefore integral to the rapid availability of Emergency Call Service.</p>

Buttons**Apply**

: Click to apply changes.

4.3.8.6 MED Network Policy

Network Policy Discovery enables the efficient discovery and diagnosis of mismatch issues with the VLAN configuration, along with the associated Layer 2 and Layer 3 attributes, which apply for a set of specific protocol applications on that port. Improper network policy configurations are a very significant issue in VoIP environments that frequently result in voice quality degradation or loss of service.

Policies are only intended for use with applications that have specific 'real-time' network policy requirements, such as interactive voice and/or video services.

The network policy attributes advertised are:

1. Layer 2 VLAN ID (IEEE 802.1Q-2003)
2. Layer 2 priority value (IEEE 802.1D-2004)
3. Layer 3 Diffserv code point (DSCP) value (IETF RFC 2474)

This network policy is potentially advertised and associated with multiple sets of application types supported on a given port.

The application types specifically addressed are:

1. Voice
2. Guest Voice
3. Softphone Voice
4. Video Conferencing
5. Streaming Video
6. Control / Signaling (conditionally support a separate network policy for the media types above)

A large network may support multiple VoIP policies across the entire organization, and different policies per application type. LLDP-MED allows multiple policies to be advertised per port, each corresponding to a different application type. Different ports on the same Network Connectivity Device may advertise different sets of policies, based on the authenticated user identity or port configuration.

It should be noted that LLDP-MED is not intended to run on links other than between Network Connectivity Devices and Endpoints, and therefore does not need to advertise the multitude of network policies that frequently run on an aggregated link interior to the LAN.

The Voice Auto Mode Configuration, Network Policy Configuration and LLDP MED Network Policy Table screen in [Figure 4-3-118](#) & [Figure 4-3-119](#) appears.

Figure 4-3-118: Voice Auto Mode Configuration and Network Policy Configuration Page Screenshot

The page includes the following Policy fields:

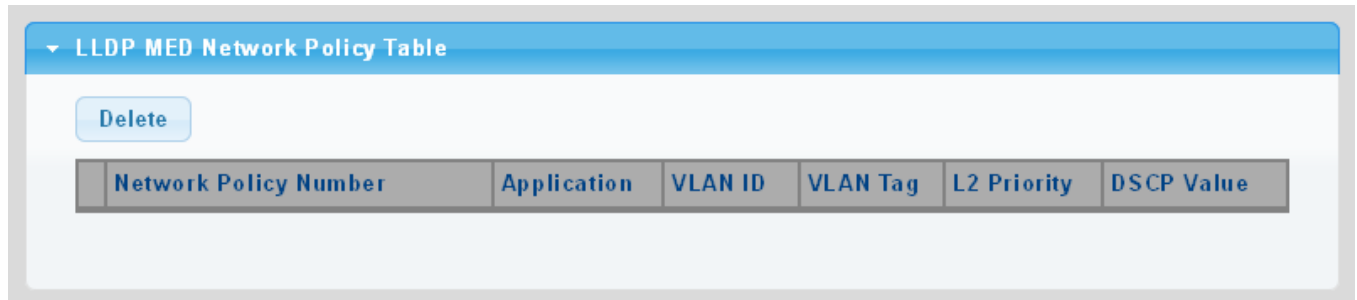

Object	Description
• LLDP MED Policy for Voice Application	Set the LLDP MED policy for voice application mode
• Network Policy Number	Select network policy number for this drop down list
• Application Type	<p>Intended use of the application types:</p> <p>Voice - for use by dedicated IP Telephony handsets and other similar appliances supporting interactive voice services. These devices are typically deployed on a separate VLAN for ease of deployment and enhanced security by isolation from data applications.</p> <p>Voice Signaling - for use in network topologies that require a different policy for the voice signaling than for the voice media. This application type should not be advertised if all the same network policies apply as those advertised in the Voice application policy.</p> <p>Guest Voice - support a separate 'limited feature-set' voice service for guest users and visitors with their own IP Telephony handsets and other similar appliances supporting interactive voice services.</p>

	<p>Guest Voice Signaling - for use in network topologies that require a different policy for the guest voice signaling than for the guest voice media. This application type should not be advertised if all the same network policies apply as those advertised in the Guest Voice application policy.</p> <p>Softphone Voice - for use by softphone applications on typical data centric devices, such as PCs or laptops. This class of endpoints frequently does not support multiple VLANs, if at all, and are typically configured to use an 'untagged' VLAN or a single 'tagged' data specific VLAN. When a network policy is defined for use with an 'untagged' VLAN (see Tagged flag below), then the L2 priority field is ignored and only the DSCP value has relevance.</p> <p>Video Conferencing - for use by dedicated Video Conferencing equipment and other similar appliances supporting real-time interactive video/audio services.</p> <p>App Streaming Video - for use by broadcast or multicast based video content distribution and other similar applications supporting streaming video services that require specific network policy treatment. Video applications relying on TCP with buffering would not be an intended use of this application type.</p> <p>Video Signaling - for use in network topologies that require a separate policy for the video signaling than for the video media. This application type should not be advertised if all the same network policies apply as those advertised in the Video Conferencing application policy.</p>
<ul style="list-style-type: none"> • VLAN ID 	VLAN identifier (VID) for the port as defined in IEEE 802.1Q-2003
<ul style="list-style-type: none"> • Tag 	<p>Tag indicating whether the specified application type is using a 'tagged' or an 'untagged' VLAN.</p> <p>Untagged indicates that the device is using an untagged frame format and as such does not include a tag header as defined by IEEE 802.1Q-2003. In this case, both the VLAN ID and the Layer 2 priority fields are ignored and only the DSCP value has relevance.</p> <p>Tagged indicates that the device is using the IEEE 802.1Q tagged frame format, and that both the VLAN ID and the Layer 2 priority values are being used, as well as the DSCP value. The tagged format includes an additional field, known as the tag header. The tagged frame format also includes priority tagged frames as defined by IEEE 802.1Q-2003.</p>
<ul style="list-style-type: none"> • L2 Priority 	L2 Priority is the Layer 2 priority to be used for the specified application type. L2 Priority may specify one of eight priority levels (0 through 7), as defined by IEEE 802.1D-2004. A value of 0 represents use of the default priority as defined in IEEE 802.1D-2004.

<ul style="list-style-type: none"> • DSCP 	DSCP value to be used to provide Diffserv node behavior for the specified application type as defined in IETF RFC 2474. DSCP may contain one of 64 code point values (0 through 63). A value of 0 represents use of the default DSCP value as defined in RFC 2475.

GE9	0	0	0	0	0	0	0
GE10	0	0	0	0	0	0	0

Figure 4-3-125: LLDP Port Statistics Page Screenshot

The page includes the following fields:

Object	Description
• Port	The port on which LLDP frames are received or transmitted.
• TX Frame – Total	The number of LLDP frames transmitted on the port.
• RX Frame – Total	The number of LLDP frames received on the port.
• RX Frame – Discarded	If an LLDP frame is received on a port, and the switch's internal table has run full, the LLDP frame is counted and discarded. This situation is known as "Too Many Neighbors" in the LLDP standard. LLDP frames require a new entry in the table when the Chassis ID or Remote Port ID is not already contained within the table. Entries are removed from the table when a given port links down, an LLDP shutdown frame is received, or when the entry ages out.
• RX Frame – Error	The number of received LLDP frames containing some kind of error.
• RX TLVs – Discarded	Each LLDP frame can contain multiple pieces of information, known as TLVs (TLV is short for "Type Length Value"). If a TLV is malformed, it is counted and discarded.
• RX TLVs – Unrecognized	The number of well-formed TLVs, but with an unknown type value
• RX Ageout - Total	The number of organizationally TLVs received

4.3.9 MAC Address Table

Switching of frames is based upon the DMAC address contained in the frame. The Managed Switch builds up a table that maps MAC addresses to switch ports for knowing which ports the frames should go to (based upon the DMAC address in the frame). This table contains both static and dynamic entries. The static entries are configured by the network administrator if the administrator wants to do a fixed mapping between the DMAC address and switch ports.

The frames also contain a MAC address (SMAC address), which shows the MAC address of the equipment sending the frame. The SMAC address is used by the switch to automatically update the MAC table with these dynamic MAC addresses. Dynamic entries are removed from the MAC table if no frame with the corresponding SMAC address has been seen after a configurable age time.

4.3.9.1 Dynamic Learned

Dynamic MAC Table

Dynamic Learned MAC Table is shown on this page. The MAC Table is sorted first by VLAN ID and then by MAC address. The Dynamic Learned screens in [Figure 4-3-126](#) & [Figure 4-3-127](#) appear.

Figure 4-3-126: Dynamic Learned Page Screenshot

The page includes the following fields:

Object	Description
• Port	Select port for this drop down list.
• VLAN	Select VLAN for this drop down list.
• MAC Address	Physical address associated with this interface.

Buttons

View: Refreshes the displayed table starting from the "Start from MAC address" and "VLAN" input fields

Clear: Flushes all dynamic entries

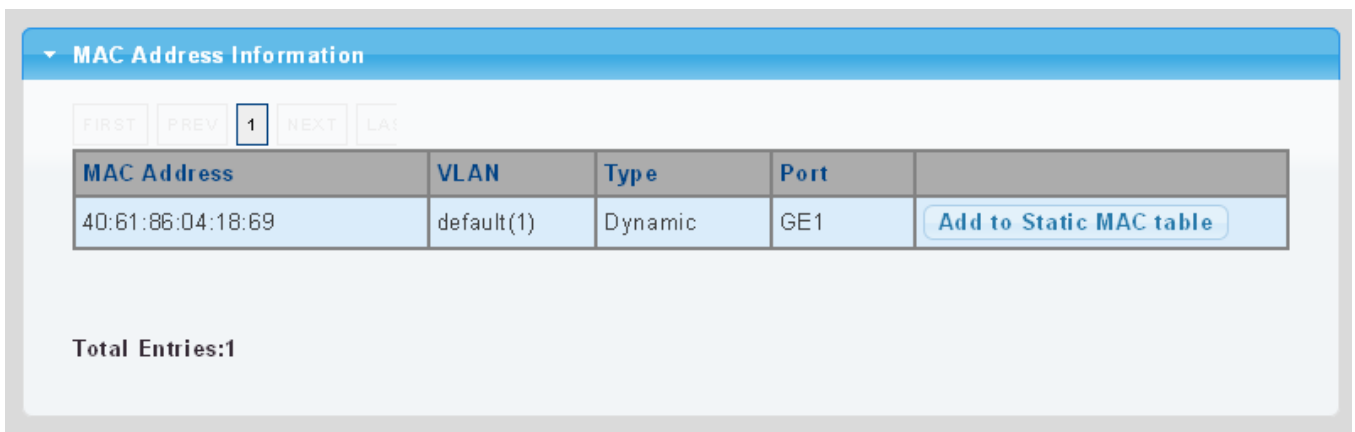

Figure 4-3-127: MAC Address Information Page Screenshot

Object	Description
• MAC Address	The MAC address of the entry.
• VLAN	The VLAN ID of the entry.
• Type	Indicates whether the entry is a static or dynamic entry.
• Port	The ports that are members of the entry.

Buttons

Add to Static MAC table

: Click to add dynamic MAC address to static MAC address.

4.3.9.2 Dynamic Address Setting

By default, dynamic entries are removed from the MAC table after 300 seconds. The Dynamic Address Setting/Status screens in [Figure 4-3-128](#) & [Figure 4-3-129](#) appear.

Figure 4-3-128: Dynamic Addresses Setting Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Aging Time 	The time after which a learned entry is discarded. Range: 10-630 seconds. Default: 300 seconds .

Buttons

• Port	Select port for this drop down list.

Buttons

Add: Click to add new static MAC address.

No.	MAC Address	VLAN	Port	Delete
1	00:30:4F:AF:FF:81	default(1)	CPU	Delete

Figure 4-3-131: Statics MAC Status Page Screenshot

The page includes the following fields:

Object	Description
• No.	This is the number for entries.
• MAC Address	The MAC address for the entry.
• VLAN	The VLAN ID for the entry.
• Port	Display the current port.
• Delete	Click Delete to delete static MAC status entry

4.3.9.4 MAC Filtering

By filtering MAC address, the switch can easily filter the per-configured MAC address and reduce the un-safety. The Static MAC Setting screens in [Figure 4-3-132](#) & [Figure 4-3-133](#) appear.

Figure 4-3-132: MAC Filtering Setting Page Screenshot

The page includes the following fields:

Object	Description
• MAC Address	Physical address associated with this interface.
• VLAN (1~4096)	Indicates the ID of this particular VLAN.

Buttons

Add: Click to add new MAC filtering setting.

Figure 4-3-133: Statics MAC Status Page Screenshot

The page includes the following fields:

Object	Description
• No.	This is the number for entries.
• MAC Address	The MAC address for the entry.
• VLAN	The VLAN ID for the entry.
• Delete	Click Delete to delete static MAC status entry.

4.4 Quality of Service

4.4.1 Understanding QoS

Quality of Service (QoS) is an advanced traffic prioritization feature that allows you to establish control over network traffic. QoS enables you to assign various grades of network service to different types of traffic, such as multi-media, video, protocol-specific, time critical, and file-backup traffic.

QoS reduces bandwidth limitations, delay, loss, and jitter. It also provides increased reliability for delivery of your data and allows you to prioritize certain applications across your network. You can define exactly how you want the switch to treat selected applications and types of traffic.

You can use QoS on your system to:

- Control a wide variety of network traffic by:
- Classifying traffic based on packet attributes.
- Assigning priorities to traffic (for example, to set higher priorities to time-critical or business-critical applications).
- Applying security policy through traffic filtering.
- Provide predictable throughput for multimedia applications such as video conferencing or voice over IP by minimizing delay and jitter.
- Improve performance for specific types of traffic and preserve performance as the amount of traffic grows.
- Reduce the need to constantly add bandwidth to the network.
- Manage network congestion.

To implement QoS on your network, you need to carry out the following actions:

1. Define a service level to determine the priority that will be applied to traffic.
2. Apply a classifier to determine how the incoming traffic will be classified and thus treated by the Switch.
3. Create a QoS profile which associates a service level and a classifier.
4. Apply a QoS profile to a port(s).

The **QoS** page of the Managed Switch contains three types of QoS mode - the **802.1p** mode, **DSCP** mode or **Port-base** mode can be selected. Both the three mode rely on predefined fields within the packet to determine the output queue.

- **802.1p Tag Priority Mode** –The output queue assignment is determined by the IEEE 802.1p VLAN priority tag.
- **IP DSCP Mode** - The output queue assignment is determined by the TOS or DSCP field in the IP packets.
- **Port-Base Priority Mode** – Any packet received from the specify high priority port will treated as a high priority packet.

The Managed Switch supports **eight priority level** queue, the queue service rate is based on the **WRR(Weight Round Robin)** and **WFQ (Weighted Fair Queuing)** alorithm. The WRR ratio of high-priority and low-priority can be set to “**4:1** and **8:1**.”

4.4.2 General

4.4.2.1 QoS Properties

The QoS Global Setting and Information screen in [Figure 4-4-1](#) & [Figure 4-4-2](#) appear.

• Unknown Multicast (Kbps/pps)	Display the current unknown multicast storm control rate.
• Unknown Unicast (Kbps/pps)	Display the current unknown unicast storm control rate.
• Action	Display the current action.

4.4.6 Voice VLAN

4.4.6.1 Introduction to Voice VLAN

Configure the switch port rate limit for the switch port on this page.

Voice VLAN is specially configured for the user voice data traffic. By setting a Voice VLAN and adding the ports of the connected voice equipments to Voice VLAN, the user will be able to configure QoS (Quality of service) service for voice data, and improve voice data traffic transmission priority to ensure the calling quality.

The switch can judge if the data traffic is the voice data traffic from specified equipment according to the source MAC address field of the data packet entering the port. The packet with the source MAC address complying with the system defined voice equipment **OUI (Organizationally Unique Identifier)** will be considered the voice data traffic and transmitted to the Voice VLAN.

The configuration is based on MAC address, acquiring a mechanism in which every voice equipment transmitting information through the network has got its unique MAC address. VLAN will trace the address belongs to specified MAC. By This means, VLAN allows the voice equipment always belong to Voice VLAN when relocated physically. The greatest advantage of the VLAN is the equipment can be automatically placed into Voice VLAN according to its voice traffic which will be transmitted at specified priority. Meanwhile, when voice equipment is physically relocated, it still belongs to the Voice VLAN without any further configuration modification, which is because it is based on voice equipment other than switch port.

Note

The Voice VLAN feature enables the voice traffic to forward on the Voice VLAN, and then the switch can be classified and scheduled to network traffic. **It is recommended there are two VLANs on a port -- one for voice, one for data.**

Note

Before connecting the IP device to the switch, **the IP phone should configure the voice VLAN ID correctly.** It should be configured through its own GUI.

4.4.6.2 Properties

The Voice VLAN feature enables voice traffic to forward on the Voice VLAN, and then the switch can be classified and scheduled to network traffic. It is recommended that there are two VLANs on a port -- one for voice, one for data.

Before connecting the IP device to the switch, the IP phone should configure the voice VLAN ID correctly. It should be configured through its own GUI. This page provides to select the ingress bandwidth preamble. The Ingress Bandwidth Control Setting/Status screen in [Figure 4-4-27](#) & [Figure 4-4-28](#) appears.

4.5 Security

This section is to control the access of the Managed Switch, including the user access and management control.

The Security Page contains links to the following main topics:

- **Access Security**
- **AAA**
- **802.1x**
- **Port Security**
- **DHCP Snooping**
- **Dynamic ARP Inspection**
- **IP Source Guard**
- **DoS**
- **Access Control List**

4.5.1 Access Security

This section is to control the access of the Managed Switch, including the different access methods – Telnet, SSH, HTTP and HTTPS.

4.5.1.1 Telnet

The Telnet Settings and Information screen in [Figure 4-5-1](#) & [Figure 4-5-2](#) appear.

Telnet Settings	
Telnet Service	Disabled ▼
Login Authentication List	default ▼
Enable Authentication List	default ▼
Session Timeout	10 (0-65535) minutes
Password Retry Count	3 (0-120)
Silent Time	0 (0-65535) seconds

Apply Disconnect

Figure 4-5-1: Telnet Settings Page Screenshot

The page includes the following fields:

Object	Description
• Telnet Service	Disable or enable telnet service.
• Login Authentication List	Select login authentication list for this drop down list.
• Enable Authentication List	Select enable authentication list for this drop down list.
• Session Timeout	Set the session timeout value.
• Password Retry Count	Set the password retry count value.
• Silent Time	Set the silent time value.

• Session Timeout	Display the current session timeout.
• Password Retry Count	Displays the current password retry count.
• Silent Time	Display the current silent time.
• Current Telnet Session Count	Display the current telnet session count

4.5.1.2 SSH

Configure SSH on this Page. This Page shows the Port Security status. Port Security is a module with no direct configuration. Configuration comes indirectly from other modules - the user modules. When a user module has enabled port security on a port, the port is set-up for software-based learning. In this mode, frames from unknown MAC addresses are passed on to the port security module, which in turn asks all user modules whether to allow this new MAC address to forward or block it. For a MAC address to be set in the forwarding state, all enabled user modules must unanimously agree on allowing the MAC address to forward. If only one chooses to block it, it will be blocked until that user module decides otherwise.

The SSH Settings and Information screens in [Figure 4-5-3](#) & [Figure 4-5-4](#) appear.

SSH Settings	
SSH Service	Disabled ▼
Login Authentication List	default ▼
Enable Authentication List	default ▼
Session Timeout	10 (0-65535) minutes

4.5.2 AAA

Authentication, authorization, and accounting (AAA) provides a framework for configuring access control on the Managed Switch. The three security functions can be summarized as follows:

- **Authentication** — Identifies users that request access to the network.
- **Authorization** — Determines if users can access specific services.
- **Accounting** — Provides reports, auditing, and billing for services that users have accessed on the network.

The AAA functions require the use of configured RADIUS or TACACS+ servers in the network. The security servers can be defined as sequential groups that are then applied as a method for controlling user access to specified services. For example, when the switch attempts to authenticate a user, a request is sent to the first server in the defined group, if there is no response the second server will be tried, and so on. If at any point a pass or fail is returned, the process stops.

The Managed Switch supports the following AAA features:

- Accounting for **IEEE 802.1X authenticated users** that access the network through the Managed Switch.
- Accounting for users that access **management interfaces** on the Managed Switch through the console and Telnet.
- Accounting for **commands** that users enter at specific CLI privilege levels. Authorization of users that access management interfaces on the Managed Switch through the console and Telnet.

To configure AAA on the Managed Switch, you need to follow this general process:

1. Configure RADIUS and TACACS+ server access parameters. See [“Configuring Local/Remote Logon Authentication”](#).
2. Define RADIUS and TACACS+ server groups to support the accounting and authorization of services.
3. Define a method name for each service to which you want to apply accounting or authorization and specify the RADIUS or TACACS+ server groups to use. Apply the method names to port or line interfaces.

This guide assumes that RADIUS and TACACS+ servers have already been configured to support AAA. The configuration of RADIUS and TACACS+ server software is beyond the scope of this guide, refer to the documentation provided with the RADIUS or TACACS+ server software.

4.5.2.1 Login List

This page is to login list parameters. The authentication list screen in [Figure 4-5-13](#) & [Figure 4-5-14](#) appears.

The screenshot shows a form titled "New Authentication List". It contains a table with five columns: "List Name", "Method 1", "Method 2", "Method 3", and "Method 4". The "List Name" column has a text input field. The "Method" columns each have a dropdown menu currently set to "Empty". Below the table is a blue "Add" button.

Figure 4-5-13: New Authentication List Screenshot

The page includes the following fields:

Object	Description
• List Name	Defines a name for the authentication list.
• Method 1-4	Set the login authentication method: Empty /None /Local /Radius/Enable

Buttons

: Click to add authentication list.

The screenshot shows a table titled "Login Authentication Lists". The table has three columns: "List Name", "Method List", and "Modify". There is one row with "default" in the "List Name" column and "local" in the "Method List" column. In the "Modify" column, there is an "Edit" button.

4.5.3 802.1X

Overview of 802.1X (Port-based) Authentication

In the 802.1X-world, the user is called the supplicant, the switch is the authenticator, and the RADIUS server is the authentication server. The switch acts as the man-in-the-middle, forwarding requests and responses between the supplicant and the authentication server. Frames sent between the supplicant and the switch are special 802.1X frames, known as **EAPOL (EAP over LANs)** frames. EAPOL frames encapsulate **EAP PDUs** (RFC3748). Frames sent between the switch and the RADIUS server are RADIUS packets. RADIUS packets also encapsulate EAP PDUs together with other attributes like the switch's IP address, name, and the supplicant's port number on the switch. EAP is very flexible, in that it allows for different authentication methods, like **MD5-Challenge**, **PEAP**, and **TLS**. The important thing is that the authenticator (the switch) doesn't need to know which authentication method the supplicant and the authentication server are using, or how many information exchange frames are needed for a particular method. The switch simply encapsulates the EAP part of the frame into the relevant type (EAPOL or RADIUS) and forwards it.

When authentication is complete, the RADIUS server sends a special packet containing a success or failure indication. Besides forwarding this decision to the supplicant, the switch uses it to open up or block traffic on the switch port connected to the supplicant.

Overview of User Authentication

It is allowed to configure the Managed Switch to authenticate users logging into the system for management access using local or remote authentication methods, such as telnet and Web browser. This Managed Switch provides secure network management access using the following options:

- **Remote Authentication Dial-in User Service (RADIUS)**
- **Terminal Access Controller Access Control System Plus (TACACS+)**
- **Local user name and Privilege Level control**

4.5.3.1 Understanding IEEE 802.1X Port-based Authentication

The IEEE 802.1X standard defines a client-server-based access control and authentication protocol that restricts unauthorized clients from connecting to a LAN through publicly accessible ports. The authentication server authenticates each client connected to a switch port before making available any services offered by the switch or the LAN.

Until the client is authenticated, 802.1X access control allows only **Extensible Authentication Protocol over LAN (EAPOL)** traffic through the port to which the client is connected. After authentication is successful, normal traffic can pass through the port.

This section includes this conceptual information:

- Device Roles
- Authentication Initiation and Message Exchange
- Ports in Authorized and Unauthorized States

■ Device Roles

With 802.1X port-based authentication, the devices in the network have specific roles as shown below.

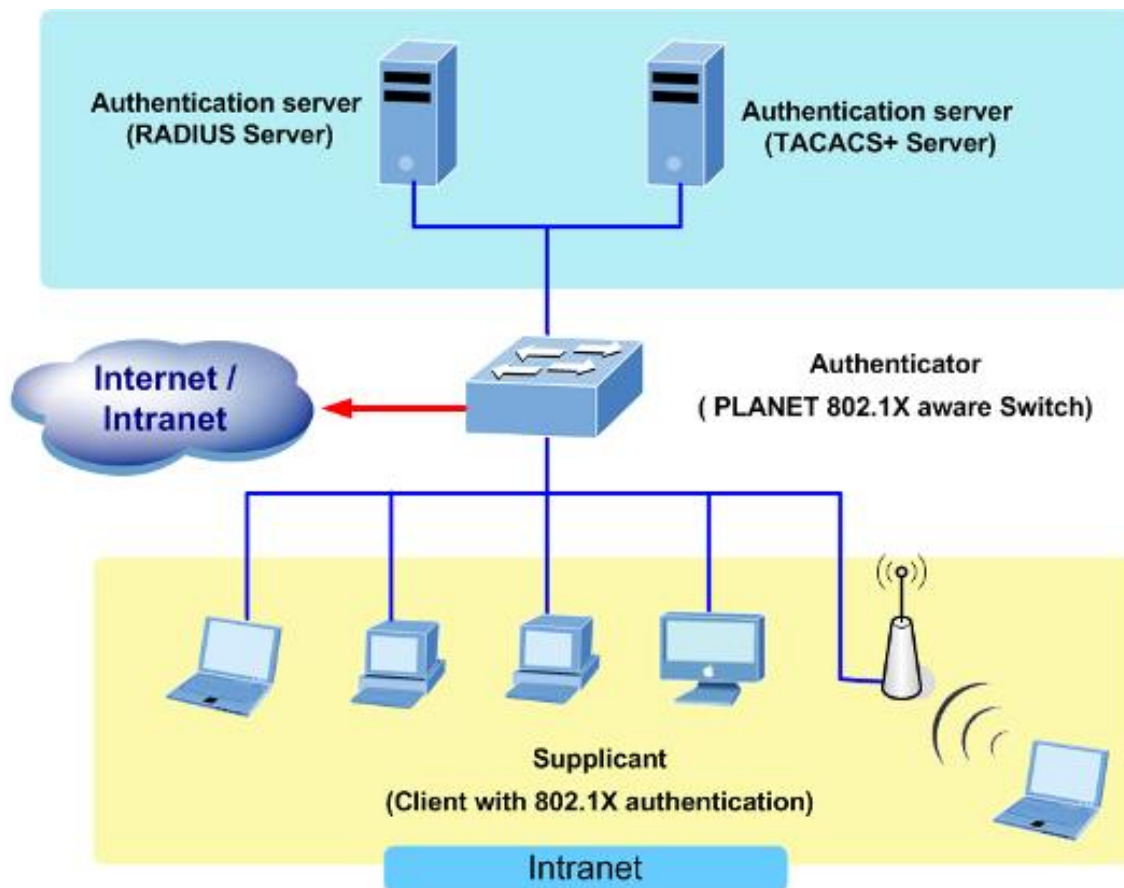

Figure 4-5-23

- **Client**—the device (workstation) that requests access to the LAN and switch services and responds to requests from the switch. The workstation must be running 802.1X-compliant client software such as that offered in the Microsoft Windows XP operating system. (The client is the *supplicant* in the IEEE 802.1X specification.)

- **Authentication server**—performs the actual authentication of the client. The authentication server validates the identity of the client and notifies the switch whether or not the client is authorized to access the LAN and switch services. Because the switch acts as the proxy, the authentication service is transparent to the client. In this release, the Remote Authentication Dial-In User Service (RADIUS) security system with **Extensible Authentication Protocol (EAP)** extensions is the only supported authentication server; it is available in Cisco Secure Access Control Server version 3.0. RADIUS operates in a client/server model in which secure authentication information is exchanged between the RADIUS server and one or more RADIUS clients.
- **Switch (802.1X device)**—controls the physical access to the network based on the authentication status of the client. The switch acts as an intermediary (proxy) between the client and the authentication server, requesting identity information from the client, verifying that information with the authentication server, and relaying a response to the client. The switch includes the RADIUS client, which is responsible for encapsulating and decapsulating the Extensible Authentication Protocol (EAP) frames and interacting with the authentication server. When the switch receives EAPOL frames and relays them to the authentication server, the Ethernet header is stripped and the remaining EAP frame is re-encapsulated in the RADIUS format. The EAP frames are not modified or examined during encapsulation, and the authentication server must support EAP within the native frame format. When the switch receives frames from the authentication server, the server's frame header is removed, leaving the EAP frame, which is then encapsulated for Ethernet and sent to the client.

■ Authentication Initiation and Message Exchange

The switch or the client can initiate authentication. If you enable authentication on a port by using the **dot1x port-control auto** interface configuration command, the switch must initiate authentication when it determines that the port link state transitions from down to up. It then sends an EAP-request/identity frame to the client to request its identity (typically, the switch sends an initial identity/request frame followed by one or more requests for authentication information). Upon receipt of the frame, the client responds with an EAP-response/identity frame. However, if during bootup, the client does not receive an EAP-request/identity frame from the switch, the client can initiate authentication by sending an EAPOL-start frame, which prompts the switch to request the client's identity

If 802.1X is not enabled or supported on the network access device, any EAPOL frames from the client are dropped. If the client does not receive an EAP-request/identity frame after three attempts to start authentication, the client transmits frames as if the port is in the authorized state. A port in the authorized state effectively means that the client has been successfully authenticated.

When the client supplies its identity, the switch begins its role as the intermediary, passing EAP frames between the client and the authentication server until authentication succeeds or fails. If the authentication succeeds, the switch port becomes authorized.

The specific exchange of EAP frames depends on the authentication method being used. “[Figure 4-5-24](#)” shows a message exchange initiated by the client using the One-Time-Password (OTP) authentication method with a RADIUS server.

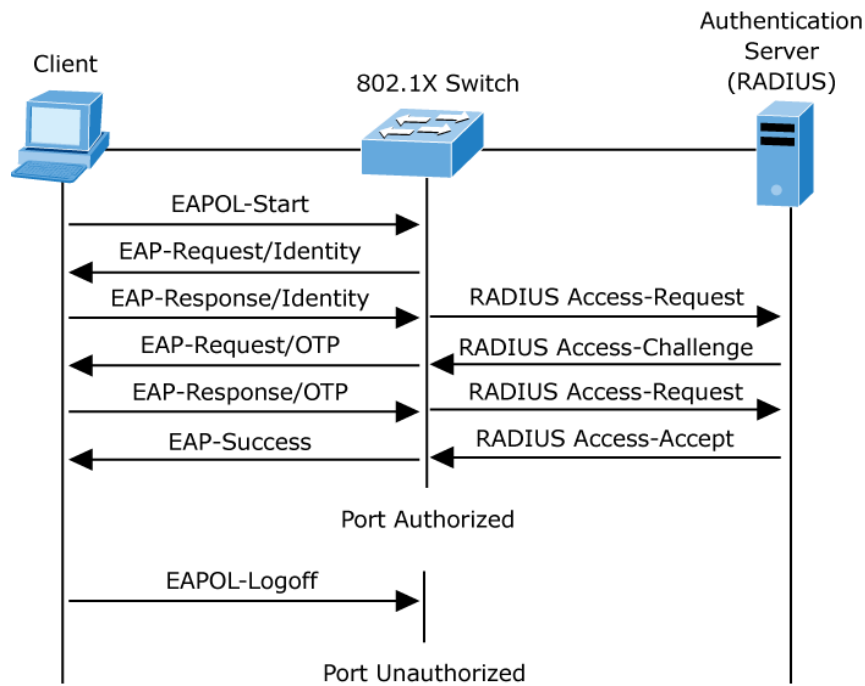

Figure 4-5-24: EAP Message Exchange

■ Ports in Authorized and Unauthorized States

The switch port state determines whether or not the client is granted access to the network. The port starts in the *unauthorized* state. While in this state, the port disallows all ingress and egress traffic except for 802.1X protocol packets. When a client is successfully authenticated, the port transitions to the *authorized* state, allowing all traffic for the client to flow normally.

If a client that does not support 802.1X is connected to an unauthorized 802.1X port, the switch requests the client's identity. In this situation, the client does not respond to the request, the port remains in the unauthorized state, and the client is not granted access to the network.

In contrast, when an 802.1X-enabled client connects to a port that is not running the 802.1X protocol, the client initiates the authentication process by sending the EAPOL-start frame. When no response is received, the client sends the request for a fixed number of times. Because no response is received, the client begins sending frames as if the port is in the authorized state.

If the client is successfully authenticated (receives an Accept frame from the authentication server), the port state changes to authorized, and all frames from the authenticated client are allowed through the port. If the authentication fails, the port remains in the unauthorized state, but authentication can be retried. If the authentication server cannot be reached, the switch can retransmit the request. If no response is received from the server after the specified number of attempts, authentication fails, and network access is not granted.

When a client logs off, it sends an EAPOL-logoff message, causing the switch port to transition to the unauthorized state.

If the link state of a port transitions from up to down, or if an EAPOL-logoff frame is received, the port returns to the unauthorized state.

4.5.3.2 802.1X Setting

This page allows you to configure the IEEE 802.1X authentication system.

The IEEE 802.1X standard defines a port-based access control procedure that prevents unauthorized access to a network by requiring users to first submit credentials for authentication. One or more central servers, the backend servers, determine whether the user is allowed access to the network. These backend (RADIUS) servers are configured on the **"Security→802.1X Access Control→802.1X Setting"** page. The IEEE802.1X standard defines port-based operation, but non-standard variants overcome security limitations as shall be explored below.

The 802.1X Setting and Information screens in [Figure 4-5-25](#) & [Figure 4-5-26](#) appear.

4.5.3.4 Guest VLAN Setting

Overview

When a Guest VLAN enabled port's link comes up, the switch starts transmitting EAPOL Request Identity frames. If the number of transmissions of such frames exceeds Max. Reauth. Count and no EAPOL frames have been received in the meantime, the switch considers entering the Guest VLAN. The interval between transmission of EAPOL Request Identity frames is configured with EAPOL Timeout. If Allow Guest VLAN if EAPOL Seen is enabled, the port will now be placed in the Guest VLAN. If disabled, the switch will first check its history to see if an EAPOL frame has previously been received on the port (this history is cleared if the port link goes down or the port's Admin State is changed), and if not, the port will be placed in the Guest VLAN. Otherwise it will not move to the Guest VLAN, but continue transmitting EAPOL Request Identity frames at the rate given by EAPOL Timeout.

Once in the Guest VLAN, the port is considered authenticated, and all attached clients on the port are allowed access on this VLAN. The switch will not transmit an EAPOL Success frame when entering the Guest VLAN.

While in the Guest VLAN, the switch monitors the link for EAPOL frames, and if one such frame is received, the switch immediately takes the port out of the Guest VLAN and starts authenticating the supplicant according to the port mode. If an EAPOL frame is received, the port will never be able to go back into the Guest VLAN if the "Allow Guest VLAN if EAPOL Seen" is disabled.

The 802.1X Guest VLAN setting screens in [Figure 4-5-29](#) & [Figure 4-5-30](#) appear.

Figure 4-5-29: Guest VLAN Setting Page Screenshot

The page includes the following fields:

4.5.3.5 Authenticated Host

The Authenticated Host Table screen in [Figure 4-5-31](#) appears.

Figure 4-5-31: Authenticated Host Table Page Screenshot

The page includes the following fields:

Object	Description
• User Name	Display the current user name.
• Port	Display the current port number.
• Session Time	Display the current session time.
• Authentication Method	Display the current authentication method.
• MAC Address	Display the current MAC address.

4.5.4 Port Security

This page allows you to configure the Port Security Limit Control system and port settings. Limit Control allows for limiting the number of users on a given port. A user is identified by a MAC address and VLAN ID. If Limit Control is enabled on a port, the limit specifies the maximum number of users on the port. If this number is exceeded, an action is taken. The action can be one of four different as described below.

The Limit Control module is one of the modules that utilize a lower-layer module while the Port Security module manages MAC addresses learned on the port.

The Limit Control configuration consists of two sections, a system- and a port-wid. The IP Source Guard Static Binding Entry and Table Status screens in [Figure 4-5-32](#) & [Figure 4-5-33](#) appear.

Port Select	Security	Max L2 Entry	Action

4.5.5 DHCP Snooping

4.5.5.1 DHCP Snooping Overview

The addresses assigned to DHCP clients on unsecure ports can be carefully controlled using the dynamic bindings registered with DHCP Snooping. DHCP snooping allows a switch to protect a network from rogue DHCP servers or other devices which send port-related information to a DHCP server. This information can be useful in tracking an IP address back to a physical port.

Command Usage

- Network traffic may be disrupted when malicious DHCP messages are received from an outside source. **DHCP snooping is used to filter DHCP messages received on a non-secure interface from outside the network or firewall.** When DHCP snooping is enabled globally and enabled on a VLAN interface, **DHCP messages received on an untrusted interface from a device not listed in the DHCP snooping table will be dropped.**
- Table entries are only learned for trusted interfaces. An entry is added or removed dynamically to the DHCP snooping table when a client receives or releases an IP address from a DHCP server. Each entry includes a MAC address, IP address, lease time, VLAN identifier, and port identifier.
- When DHCP snooping is enabled, DHCP messages entering an untrusted interface are filtered based upon dynamic entries learned via DHCP snooping.

- Filtering rules are implemented as follows:
 - If the global DHCP snooping is disabled, all DHCP packets are forwarded.
 - If DHCP snooping is enabled globally, and also enabled on the VLAN where the DHCP packet is received, all DHCP packets are forwarded for a trusted port. If the received packet is a DHCP ACK message, a dynamic DHCP snooping entry is also added to the binding table.
 - If DHCP snooping is enabled globally, and also enabled on the VLAN where the DHCP packet is received, but the port is not trusted, it is processed as follows:
 - If the DHCP packet is a reply packet from a DHCP server (including OFFER, ACK or NAK messages), the packet is dropped.
 - If the DHCP packet is from a client, such as a DECLINE or RELEASE message, the switch forwards the packet only if the corresponding entry is found in the binding table.
 - If the DHCP packet is from a client, such as a DISCOVER, REQUEST, INFORM, DECLINE or RELEASE message, the packet is forwarded if MAC address verification is disabled. However, if MAC address verification is enabled, then the packet will only be forwarded if the client's hardware address stored in the DHCP packet is the same as the source MAC address in the Ethernet header.
 - If the DHCP packet is not a recognizable type, it is dropped.
- If a DHCP packet from a client passes the filtering criteria above, it will only be forwarded to trusted ports in the same VLAN.
- If a DHCP packet from server is received on a trusted port, it will be forwarded to both trusted and untrusted ports in the same VLAN.
- If the DHCP snooping is globally disabled, all dynamic bindings are removed from the binding table.
 - Additional considerations when the switch itself is a DHCP client – The port(s) through which the switch submits a client request to the DHCP server must be configured as trusted. Note that the switch will not add a dynamic entry for itself to the binding table when it receives an ACK message from a DHCP server. Also, when the switch sends out DHCP client packets for itself, no filtering takes place. However, when the switch receives any messages from a DHCP server, any packets received from untrusted ports are dropped.

4.5.5.2 Global Setting

DHCP Snooping is used to block intruder on the untrusted ports of switch when it tries to intervene by injecting a bogus DHCP reply packet to a legitimate conversation between the DHCP client and server. Configure DHCP Snooping on this page. The DHCP Snooping Setting and Information screens in [Figure 4-5-34](#) & [Figure 4-5-35](#) appear.

Figure 4-5-34: DHCP Snooping Setting Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> DHCP Snooping 	<p>Indicates the DHCP snooping mode operation. Possible modes are:</p> <ul style="list-style-type: none"> Enabled: Enable DHCP snooping mode operation. When enable DHCP snooping mode operation, the request DHCP messages will be forwarded to trusted ports and only allowed reply packets from trusted ports. Disabled: Disable DHCP snooping mode operation.

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> DHCP Snooping 	Display the current DHCP snooping status.

4.5.5.3 VLAN Setting

Command Usage

- When DHCP snooping is enabled globally on the switch, and enabled on the specified VLAN, DHCP packet filtering will be performed on any untrusted ports within the VLAN.
- When the DHCP snooping is globally disabled, DHCP snooping can still be configured for specific VLANs, but the changes will not take effect until DHCP snooping is globally re-enabled.
- When DHCP snooping is globally enabled, and DHCP snooping is then disabled on a VLAN, all dynamic bindings learned for this VLAN are removed from the binding table.

The DHCP Snooping VLAN Setting screens in [Figure 4-5-36](#) & [Figure 4-5-37](#) appear.

Figure 4-5-36: DHCP Snooping VLAN Setting Page Screenshot

The page includes the following fields:

• Status	Display the current DHCP snooping status.

4.5.5.4 Port Setting

Configures switch ports as trusted or untrusted.

Command Usage

- A trusted interface is an interface that is configured to receive only messages from within the network. An untrusted interface is an interface that is configured to receive messages from outside the network or firewall.
- When DHCP snooping enabled both globally and on a VLAN, DHCP packet filtering will be performed on any untrusted ports within the VLAN.
- When an untrusted port is changed to a trusted port, all the dynamic DHCP snooping bindings associated with this port are removed.
- Set all ports connected to DHCP servers within the local network or firewall to trusted state. Set all other ports outside the local network or firewall to untrusted state.

The DHCP Snooping Port Setting screen in [Figure 4-5-38](#) & [Figure 4-5-39](#) appears.

4.5.5.6 Database Agent

Overview of the DHCP Snooping Database Agent

When DHCP snooping is enabled, the switch uses the DHCP snooping binding database to store information about untrusted interfaces. The database can have up to 8192 bindings.

Each database entry (*binding*) has an IP address, an associated MAC address, the lease time (in hexadecimal format), the interface to which the binding applies, and the VLAN to which the interface belongs. A *checksum* value, the end of each entry, is the number of bytes from the start of the file to end of the entry. Each entry is 72 bytes, followed by a space and then the checksum value.

To keep the bindings when the switch reloads, you must use the DHCP snooping database agent. If the agent is disabled, dynamic ARP or IP source guard is enabled, and the DHCP snooping binding database has dynamic bindings, the switch loses its connectivity. If the agent is disabled and only DHCP snooping is enabled, the switch does not lose its connectivity, but DHCP snooping might not prevent DHCP spoofing attacks.

The database agent stores the bindings in a file at a configured location. When reloading, the switch reads the binding file to build the DHCP snooping binding database. The switch keeps the file current by updating it when the database changes.

When a switch learns of new bindings or when it loses bindings, the switch immediately updates the entries in the database. The switch also updates the entries in the binding file. The frequency at which the file is updated is based on a configurable delay, and the updates are batched. If the file is not updated in a specified time (set by the write-delay and abort-timeout values), the update stops.

The DHCP Snooping Database and Information screens in [Figure 4-5-41](#) & [Figure 4-5-42](#) appear.

4.5.5.8 Option82 Global Setting

DHCP provides a relay mechanism for sending information about the switch and its DHCP clients to DHCP servers. Known as **DHCP Option 82**, it allows compatible DHCP servers to use the information when assigning IP addresses, or to set other services or policies for clients. It is also an effective tool in preventing malicious network attacks from attached clients on DHCP services, such as IP Spoofing, Client Identifier Spoofing, MAC Address Spoofing, and Address Exhaustion.

The **DHCP option 82** enables a DHCP relay agent to insert specific information into a DHCP request packets when forwarding client DHCP packets to a DHCP server and remove the specific information from a DHCP reply packets when forwarding server DHCP packets to a DHCP client. The DHCP server can use this information to implement IP address or other assignment policies. Specifically the option works by setting two sub-options:

- Circuit ID (option 1)
- Remote ID (option2).

The Circuit ID sub-option is supposed to include information specific to which circuit the request came in on.

The Remote ID sub-option was designed to carry information relating to the remote host end of the circuit.

The definition of Circuit ID in the switch is 4 bytes in length and the format is "vlan_id" "module_id" "port_no". The parameter of "vlan_id" is the first two bytes represent the VLAN ID. The parameter of "module_id" is the third byte for the module ID (in standalone switch it always equal 0, in switch it means switch ID). The parameter of "port_no" is the fourth byte and it means the port number.

After enabling DHCP snooping, the switch will monitor all the DHCP messages and implement software transmission. The DHCP Rate Limit Setting and Config screens in [Figure 4-5-45](#) & [Figure 4-5-46](#) appear.

4.5.5.9 Option82 Port Setting

This function is used to set the retransmitting policy of the system for the received DHCP request message which contains option82.

- The **drop** mode means that if the message has option82, then the system will drop it without processing.
- The **keep** mode means that the system will keep the original option82 segment in the message, and forward it to the server to process
- The **replace** mode means that the system will replace the option 82 segment in the existing message with its own option 82, and forward the message to the server to process.

Option82 Port Setting screens in [Figure 4-5-47](#) & [Figure 4-5-48](#) appear.

4.5.6 Dynamic ARP Inspection

Dynamic ARP Inspection (DAI) is a secure feature. Several types of attacks can be launched against a host or devices connected to Layer 2 networks by "poisoning" the ARP caches. This feature is used to block such attacks. Only valid ARP requests and responses can go through DUT. This page provides ARP Inspection related configuration.

A Dynamic ARP prevents the untrust ARP packets based on the DHCP Snooping Database.

4.5.6.1 Global Setting

DAI Setting and Information screens in [Figure 4-5-51](#) & [Figure 4-5-52](#) appear.

4.5.7 IP Source Guard

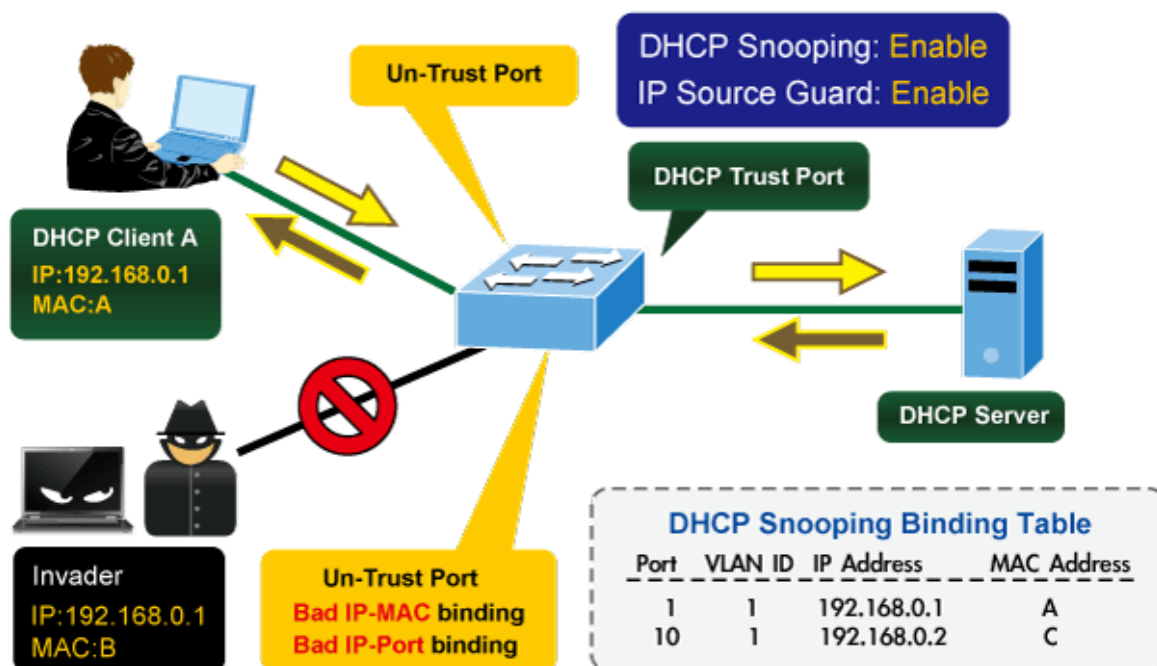

IP Source Guard is a secure feature used to restrict IP traffic on DHCP snooping untrusted ports by filtering traffic based on the DHCP Snooping Table or manually configured IP Source Bindings. It helps prevent IP spoofing attacks when a host tries to spoof and use the IP address of another host.

After receiving a packet, the port looks up the key attributes (including IP address, MAC address and VLAN tag) of the packet in the binding entries of the IP source guard. If there is a matching entry, the port will forward the packet. Otherwise, the port will abandon the packet.

IP source guard filters packets based on the following types of binding entries:

- IP-port binding entry
- MAC-port binding entry
- IP-MAC-port binding entry

IP Source Guard Overview

4.5.7.1 Port Settings

IP Source Guard is a secure feature used to restrict IP traffic on **DHCP snooping untrusted ports** by filtering traffic based on the DHCP Snooping Table or manually configured IP Source Bindings. It helps prevent IP spoofing attacks when a host tries to spoof and use the IP address of another host.

The IP Source Guard Port Setting and Information screens in [Figure 4-5-60](#) & [Figure 4-5-61](#) appear.

Port	Status	Verify Source	Max Binding Entry
Select Ports	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled	<input checked="" type="radio"/> IP <input type="radio"/> IP and MAC	No-limited

Apply

4.5.8 DoS

The DoS is short for **Denial of Service**, which is a simple but effective destructive attack on the internet. The server under DoS attack will drop normal user data packet due to non-stop processing the attacker's data packet, leading to the denial of the service and worse can lead to leak of sensitive data of the server.

Security feature refers to applications such as protocol check which is for protecting the server from attacks such as DoS. The protocol check allows the user to drop matched packets based on specified conditions. The security features provide several simple and effective protections against Dos attacks while acting no influence on the linear forwarding performance of the switch.

4.5.8.1 Global DoS Setting

The Global DoS Setting and Information screens in [Figure 4-5-64](#) & [Figure 4-5-65](#) appear.

Global DoS Setting

• DoS Protection	Display the current DoS protection.

4.5.9 Access Control List

ACL is an acronym for **Access Control List**. It is the list table of ACEs, containing access control entries that specify individual users or groups permitted or denied to specific traffic objects, such as a process or a program. Each accessible traffic object contains an identifier to its ACL. The privileges determine whether there are specific traffic object access rights.

ACL implementations can be quite complex, for example, when the ACEs are prioritized for the various situation. In networking, the ACL refers to a list of service ports or network services that are available on a host or server, each with a list of hosts or servers permitted or denied to use the service. ACL can generally be configured to control inbound traffic, and in this context, they are similar to firewalls.

ACE is an acronym for **Access Control Entry**. It describes access permission associated with a particular ACE ID. There are three ACE frame types (Ethernet Type, ARP, and IPv4) and two ACE actions (permit and deny). The ACE also contains many detailed, different parameter options that are available for individual application.

The ACL page contains links to the following main topics:

- | | |
|----------------------------------|--|
| ■ MAC-Based ACL | Configuration MAC-based ACL setting |
| ■ MAC-Based ACE | Add/Edit /Delete the MAC-based ACE (Access Control Entry) setting |
| ■ IPv4-Based ACL | Configuration IPv4-based ACL setting |
| ■ IPv4-Based ACE | Add/Edit /Delete the IPv4-based ACE (Access Control Entry) setting |
| ■ IPv6-Based ACL | Configuration IPv6-based ACL setting |
| ■ IPv6-Based ACE | Add / Edit /Delete the IPv6-based ACE (Access Control Entry) setting |
| ■ ACL Binding | Configure the ACL parameters (ACE) of each switch port. |

4.5.9.1 MAC-Based ACL

This page shows the ACL status by different ACL users. Each row describes the ACE that is defined. It is a conflict if a specific ACE is not applied to the hardware due to hardware limitations. MAC-based ACL screens in [Figure 4-5-68](#) & [Figure 4-5-69](#) appear.

Figure 4-5-68: MAC-Based ACL Page Screenshot

The page includes the following fields:

4.5.9.5 IPv6-Based ACL

This page shows the ACL status by different ACL users. Each row describes the ACE that is defined. It is a conflict if a specific ACE is not applied to the hardware due to hardware limitations. IPv6-based ACL screens in [Figure 4-5-76](#) & [Figure 4-5-77](#) appear.

Figure 4-5-76: IPv6-Based ACL Page Screenshot

The page includes the following fields:

Object	Description
• ACL Name	Create a named IPv6-Based ACL list

Buttons

: Click to add ACL name list.

The page includes the following fields:

Object	Description
• ACL Name	Click  to delete ACL name entry.

4.5.9.6 IPv6-based ACE

An ACE consists of several parameters. Different parameter options are displayed depending on the frame type that you selected. The IPv6-based ACE screens in [Figure 4-5-78](#) & [Figure 4-5-79](#) appear.

IPv6-Based ACE	
ACL Name	<input type="text" value=""/>
Sequence	<input type="text" value=""/> (Range: 1 - 2147483647, 1 is first processed)
Action	<input checked="" type="radio"/> Permit <input type="radio"/> Deny <input type="radio"/> Shutdown
Protocol	<input checked="" type="radio"/> Any(IP) <input type="radio"/> Select from list <input type="text" value="tcp"/>
Source IP Address	<input checked="" type="radio"/> Any <input type="radio"/> User Defined
Source IP Address Value	<input type="text" value=""/>
Source IP Prefix Length	<input type="text" value="0"/> (Range: 0 - 128)
Destination IP Address	<input checked="" type="radio"/> Any <input type="radio"/> User Defined
Destination IP Address Value	<input type="text" value=""/>
Destination IP Prefix Length	<input type="text" value="0"/> (Range: 0 - 128)
Source Port	<input checked="" type="radio"/> Any <input type="radio"/> Single <input type="text" value="0"/> (Range: 0 - 65535) <input type="radio"/> Range <input type="text" value="0"/> - <input type="text" value="65535"/> (Range: 0 - 65535)
Destination Port	<input checked="" type="radio"/> Any <input type="radio"/> Single(Range: 0 - 65535) <input type="text" value="0"/> (Range: 0 - 65535) <input type="radio"/> Range(Range: 0 - 65535) <input type="text" value="0"/> - <input type="text" value="65535"/> (Range: 0 - 65535)

Figure 4-5-81: ACL Binding Table Page Screenshot

The page includes the following fields:

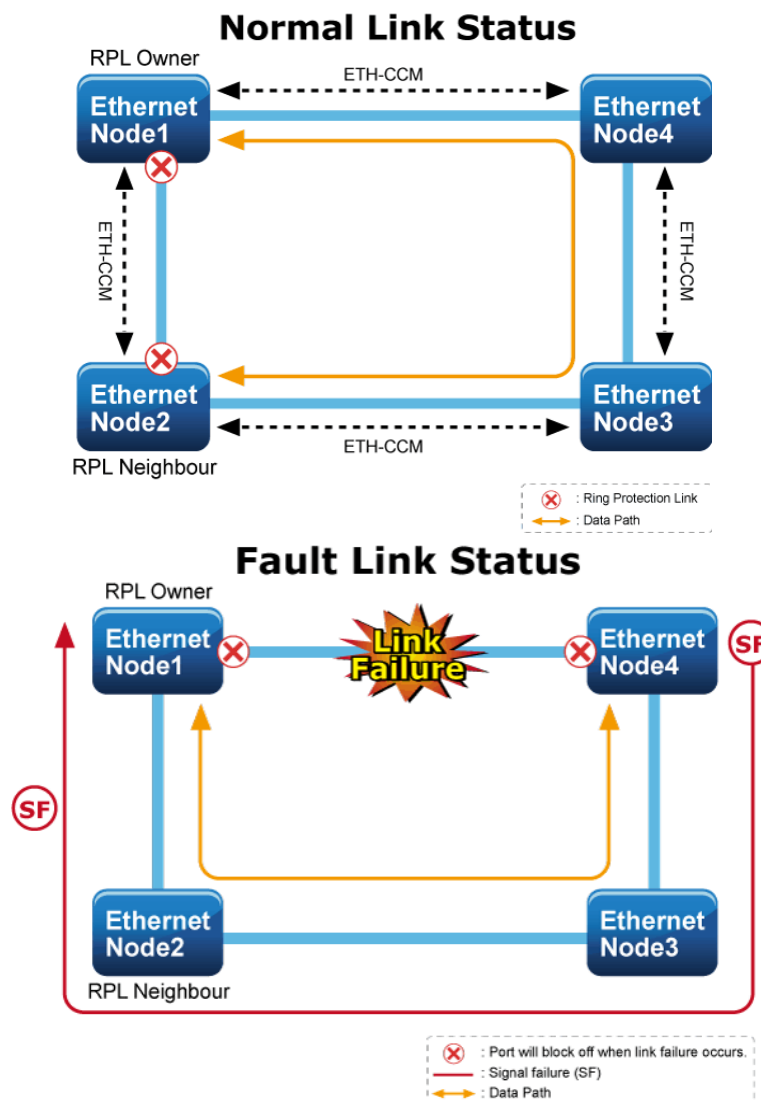

Object	Description
• Port	The switch port number of the logical port.
• MAC ACL	Display the current MAC ACL.
• IPv4 ACL	Display the current IPv4 ACL.
• IPv6 ACL	Display the current IPv6 ACL.
• Modify	<p>Click  to edit ACL binding table parameter</p> <p>Click  to delete ACL binding entry</p>

4.6 Ring

Use the Maintenance menu items to display and configure basic configurations of The Wall-mount Managed Switch. Under maintenance, the following topics are provided to back up, upgrade, save and restore the configuration. This section has the following items:

- **Ring Wizard** You can quickly build an ERPS ring by wizard.
- **ERPS** You can configure ERPS ring in detail.

ITU-T G.8032 **Ethernet Ring protection switching (ERPS)** is a link layer protocol applied on Ethernet loop protection to provide sub-50ms protection and recovery switching for Ethernet traffic in a ring topology. ERPS provides a faster redundant recovery than Spanning Tree topology. The action is similar to STP or RSTP, but the algorithms between them are not the same. In the Ring topology, every switch should be enabled with Ring function and two ports should be assigned as the member ports in the ERPS. Only one switch in the Ring group would be set as the RPL owner switch that one port would be blocked, called **owner port**, and PRL neighbor switch has one port that one port would be blocked, called **neighbor port** that connect to owner port directly and this link is called the **Ring Protection Link** or **RPL**. Each switch will send ETH-CCM message to check the link status in the ring group. When the failure of network connection occurs, the nodes block the failed link and report the signal failure message, the RPL owner switch will automatically unblocks the PRL to recover from the failure.

4.6.1 Ring Wizard

This page allows the user to configure the ERPS by wizard; screen in [Figure 4-6-1](#) appears.

Ring Wizard

Note:
 1. Please make sure the DHCP client function has been disabled.
 2. Please note that the ring port cannot be applied to spanning tree function at the same time.

Total Switch Number (3 ~ 30): Switch ID:

Configuration

Switch-3

(Owner)
 Port Switch-1
 Vlan

(Neighbor)
 Port Switch-2

Figure 4-6-1: Ring Wizard page screenshot

The page includes the following fields:

Object	Description
• All Switch Numbers	Set all the switch numbers for the ring group. The default number is 3 and maximum number is 30.
• Number ID	The switch where you are requesting ERPS.
• Port	Configures the port number for the MEP.
• VLAN	Set the ERPS VLAN.

Buttons

: Click to configure ERPS.

: Click to save changes.

: Click to show the ring topology.

4.6.2 ERPS

This page allows the user to inspect and configure the current ERPS Instance; screen in [Figure 4-6-2](#) and [Figure 4-6-3](#) appears.

Ethernet Ring Protection Switching

Note:

1. Please make sure the DHCP client function has been disabled.

2. Please note that the ring port can not be applied to spanning tree function at the same time.

Delete	Enable	ERPS ID	Version	Ring Type	Port0	Port1	Node ID	Control Vlan	Revertive	Guard Time	WTR Time	Holdoff Time
<input type="checkbox"/>	Yes	1	2	Major	5	6	00:30:4f:1a:12:35	3001	Yes	500	1	0

Figure 4-6-2: Ethernet Ring Protocol Switch page screenshot

Object	Description
• Enable	Enables ERPS on the switch. ERPS must be enabled globally on the switch before it can enable on an ERPS ring.
• ERPS ID	Major ring group ID for the interconnected sub-ring. It is used to send topology change updates on major ring. If ring is major, this value is same as the protection group ID of this ring.
• Version	ERPS Protocol Version - v1 or v2
• Ring Type	Type of Protecting ring.
• Port 0	This will create a Port 0 of the switch in the ring.
• Port 1	This will create "Port 1" of the switch in the Ring. As interconnected sub-ring will have only one ring port, "Port 1" is configured as "0" for interconnected sub-ring. "0" in this field indicates that no "Port 1" is associated with this instance
• Node ID	A MAC address unique to the ring node. The MAC address must be specified in the format xx:xx:xx:xx:xx:xx
• Control Vlan	VLAN configuration of the Protection Group.
• Revertive	ERPS Protocol Version - v1 or v2
• Guard Time	Guard timeout value to be used to prevent ring nodes from receiving outdated R-APS messages. The period of the guard timer can be configured in 10 ms steps between 10 ms and 2 seconds, with a default value of 500 ms
• WTR Time	Remaining WTR timeout in milliseconds.
• Holdoff Time	The timing value to be used to make persistent check on Signal Fail before switching. The range of the hold off timer is 0 to 10 seconds in steps of 100 ms

Buttons

Add New Protection Group

: Click to add a new Protection group entry.

Refresh

: Click to refresh the page immediately.

Save

: Click to save changes.

Reset

: Click to undo any changes made locally and revert to previously saved values.

Figure 4-6-3: Ethernet Ring Protocol Switch Configuration page screenshot**PRL Configuration:**

Object	Description
• PRL Role	It can be either RPL owner or RPL Neighbor.
• PRL Port	This allows to select the east port or west port as the RPL block.
• Clear	If the owner has to be changed, then the clear check box allows to clear the RPL owner for that ERPS ring.

Instance Command:

Object	Description
• Command	Administrative command. A port can be administratively configured to be in either manual switch or forced switch state.
• Port	Port selection - Port0 or Port1 of the protection Group on which the command is applied.

ERPS state:

Object	Description
• Protection State	ERPS state according to State Transition Tables in G.8032.
• Port 0	OK: State of East port is ok SF: State of East port is Signal Fail
• Port 1	OK: State of West port is ok SF: State of West port is Signal Fail
• WTR Remaining	Remaining WTR timeout in milliseconds.
• RPL Un-blocked	APS is received on the working flow.
• Port 0 Block Status	Block status for Port 0 (Both traffic and R-APS block status). R-APS channel is never blocked on sub-rings without virtual channel.
• Port 1 Block Status	Block status for Port 1 (Both traffic and R-APS block status). R-APS channel is never blocked on sub-rings without virtual channel.

4.7 Power over Ethernet

The GS-4210 802.3at PoE+ series can easily build a power central-controlled IP phone system, IP camera system and AP group for the enterprise. For instance, cameras/APs can be easily installed around the corner in the company for surveillance demands or build a wireless roaming environment in the office. Without the power-socket limitation, the GS-4210 802.3at PoE+ series makes the installation of cameras or WLAN APs easier and more efficient.

PoE Power Budget list for GS-4210 802.3at PoE+ Switch Series.

Model Name	PoE Budget
GS-4210-8P2S	140 watts, operating temperature around 25 degrees C 120 watts, operating temperature around 50 degrees C
GS-4210-8P2C	120 watts
GS-4210-16P2S	220 watts
GS-4210-16P4C	240 watts
GS-4210-24P2S	300 watts
GS-4210-24P4C	280 watts
GS-4210-24PL4C	430 watts
GS-4210-48P4S	600 watts, operating temperature around 25 degrees C 500 watts, operating temperature around 25 degrees C

- 1: The following web screen based on the GS-4210-24P2S is the same as those of other GS-4210 802.3at PoE+ Switch Series.
- 2: The PoE function is only available for GS-4210-8P2S, GS-4210-8P2C, GS-4210-16P2S, GS-4210-16P4C, GS-4210-24P2Sv3, GS-4210-24P4Cv3, GS-4210-24PL4C and GS-4210-48P4S.

Figure 4-7-1: Power over Ethernet Web Screen

4.7.1 Power over Ethernet Powered Device

 <p>3~5 watts</p>	<p>Voice over IP phones</p> <p>Enterprise can install POE VoIP Phone, ATA and other Ethernet/non-Ethernet end-devices in the central area where UPS is installed for un-interruptible power system and power control system.</p>
 <p>6~12 watts</p>	<p>Wireless LAN Access Points</p> <p>Museums, sightseeing spots, airports, hotels, campuses, factories, and warehouses can install the Access Point anywhere.</p>
 <p>10~12 watts</p>	<p>IP Surveillance</p> <p>Enterprises, museums, campuses, hospitals and banks can install IP camera without the limit of the installation location. Electrician is not needed to install AC sockets.</p>
 <p>3~60 watts</p>	<p>PoE Splitter</p> <p>PoE Splitter splits the PoE DC over the Ethernet cable into 5/12/19/24V DC power output. It frees the device deployment from restrictions due to power outlet locations, which eliminate the costs for additional AC wiring and reduces the installation time.</p>
 <p>30~60 watts</p>	<p>High Power Speed Dome</p> <p>This state-of-the-art design is considerable to fit in various network environments like traffic centers, shopping malls, railway stations, warehouses, airports, and production facilities for the most demanding outdoor surveillance applications. Electrician is not needed to install AC sockets.</p>

4.7.2 Power over Ethernet Configuration

This section allows the user to inspect and configure the current PoE configuration setting as screen in [Figure 4-7-2](#) appears.

The screenshot shows a 'PoE Configuration' window with three rows of settings:

PoE Configuration	
System PoE Admin Mode	Enable ▾
PoE Management Mode	Consumption ▾
Temperature Threshold	120 Degrees C

Figure 4-7-2: PoE Configuration Screenshot

The page includes the following fields:

Object	Description
• System PoE Admin Mode	Allows user to enable or disable PoE function. It will cause all of PoE ports to supply or not to supply power.
• PoE Management Mode	Provide Allocation and Consumption mode option.
• Temperature Threshold	Allows setting over temperature protection threshold value. If its system temperature is over the threshold then system will lower total PoE power budget automatically.

This section displays the **PoE Power Usage** of Current Power Consumption as [Figure 4-7-3](#) shows.

The screenshot shows a 'Power Allocation' bar with a green indicator and the text '0 W / 300 W'.

Figure 4-7-3: Current Power Consumption Screenshot

This section allows the user to inspect and configure the current PoE port settings as Figure 4-7-4 shows.

4.7.3 PoE Status

This page displays to per port PoE usage status, the screen in [Figure 4-7-5](#) appears.

Figure 4-7-5: PoE Status Screenshot

The page includes the following fields:

Object	Description
• Port Number	Displays per port status.
• Watt.	Displays per port PoE usage.

4.7.4 PoE Schedule

This page allows the user to define PoE schedule and scheduled power recycling.

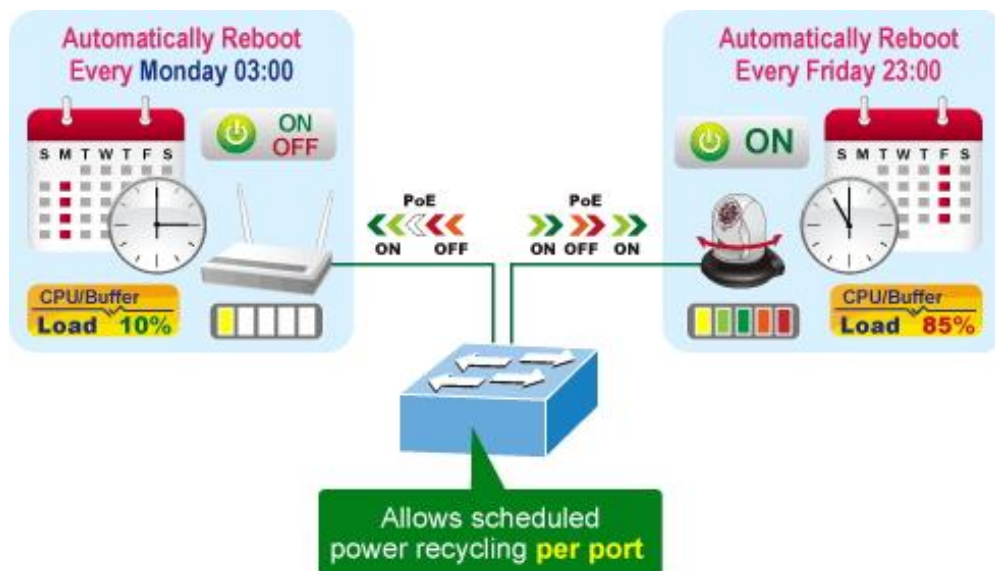

PoE Schedule

Besides being used as an IP Surveillance, the Managed PoE switch is certainly applicable to construct any PoE network including VoIP and Wireless LAN. Under the trend of energy saving worldwide and contributing to the environmental protection on the Earth, the Managed PoE switch can effectively control the power supply besides its capability of giving high watts power. The “**PoE schedule**” function helps you to enable or disable PoE power feeding for each PoE port during specified time intervals and it is a powerful function to help SMB or Enterprise saving power and money.

Scheduled Power Recycling

The Managed PoE switch allows each of the connected PoE IP cameras to reboot at a specified time each week. Therefore, it will reduce the chance of IP camera crash resulting from buffer overflow.

The screen in [Figure 4-7-6](#) appears.

Figure 4-7-6: PoE Schedule Screenshot

Please press **Add New Rule** button to start setting PoE Schedule function. You have to set PoE schedule to profile and then go back to PoE Port Configuration, and select **"Schedule"** mode from per port **"PoE Mode"** option to enable you to indicate which schedule profile could be applied to the PoE port.

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Profile 	Set the schedule profile mode. Possible profiles are: Profile1 Profile2 Profile3 Profile4
<ul style="list-style-type: none"> Week Day 	Allows user to set week day for defining PoE function by enabling it on the day.
<ul style="list-style-type: none"> Start Hour 	Allows user to set what hour PoE function does by enabling it.
<ul style="list-style-type: none"> Start Min 	Allows user to set what minute PoE function does by enabling it.

• End Hour	Allows user to set what hour PoE function does by disabling it.
• End Min	Allows user to set what minute PoE function does by disabling it.
• Reboot Enable	Allows user to enable or disable the whole PoE port reboot by PoE reboot schedule. Please note that if you want PoE schedule and PoE reboot schedule to work at the same time, please use this function, and don't use Reboot Only function. This function offers administrator to reboot PoE device at an indicated time if administrator has this kind of requirement.
• Reboot Only	Allows user to reboot PoE function by PoE reboot schedule. Please note that if administrator enables this function, PoE schedule will not set time to profile. This function is just for PoE port to reset at an indicated time.
• Reboot Hour	Allows user to set what hour PoE reboots. This function is only for PoE reboot schedule.
• Reboot Min	Allows user to set what minute PoE reboots. This function is only for PoE reboot schedule.

Buttons

: Click to add new rule.

: Click to apply changes

: Check to delete the entry.

4.7.5 Alive Check Configuration

The GS-4210 802.3at PoE+ series can be configured to monitor connected PD's status in real-time via ping action. Once the PD stops working and without response, the PoE Switch is going to restart PoE port power, and bring the PD back to work. It will greatly enhance the reliability and reduces administrator management burden.

This page provides you with how to configure PD Alive Check. The screen in [Figure 4-7-7](#) appears.

PD Alive Check					
Port Select	Mode	Interval Time (2~300s)	Retry Count (1~5)	Action	PD Reboot Time (5~180s)
Select Ports ▼	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled	30	2 ▼	None ▼	90

Apply

Figure 4-7-7: PD Alive Check Configuration Screenshot

The page includes the following fields:

Object	Description
• Mode	Allows user to enable or disable per port PD Alive Check function. By default, all ports are disabled.
• Ping PD IP Address	This column allows user to set PoE device IP address for system making ping to the PoE device. Please note that the PD's IP address must be set to the same network segment with the PoE Switch.
• Interval Time (2~300s)	This column allows user to set how long system should issue a ping request to PD for detecting whether PD is alive or dead. Interval time range is from 2 seconds to 300 seconds.
• Retry Count (1~5)	This column allows user to set the number of times system retries ping to PD. For example, if we set count 2, it means that if system retries ping to the PD and the PD doesn't response continuously, the PoE port will be reset.
• Action	Allows user to set which action will be applied if the PD is without any response. The PoE Switch Series offers the following 3 actions: <ul style="list-style-type: none"> ■ PD Reboot: It means system will reset the PoE port that is connected to the PD. ■ PD Reboot & Alarm: It means system will reset the PoE port and issue an alarm message via Syslog. ■ Alarm: It means system will issue an alarm message via Syslog.
• PD Reboot Time (5~180s)	This column allows user to set the PoE device rebooting time as there are so many kinds of PoE devices on the market and they have a different rebooting time. The PD Alive-check is not a defining standard, so the PoE device on the market doesn't report reboot done information to the PoE Switch. Thus, user has to make sure how long the PD will take to finish booting, and then set the time value to this column. System is going to check the PD again according to the reboot time. If you are not sure of the precise booting time, we suggest you set it longer.

Buttons

Figure 4-7-8: PD Alive Check Configuration Screenshot

4.8 Maintenance

Use the Maintenance menu items to display and configure basic configurations of the Managed Switch. Under maintenance, the following two topics are provided:

- **Switch Maintenance** You can save the configuration, reboot or reset default, configuration backup/restore of the switch on this page.
- **Diagnostics** You can run the cable diagnostics or ping IPv4/IPv6 IP address of the switch on this page.

4.8.1 Switch Maintenance

Under the switch maintenance, the following topics are provided to back up, upgrade, save and restore the configuration. This section has the following items:

- **Save Configuration** You can save the configuration of the switch on this page.
- **Factory Default** You can reset default the configuration of the switch on this page.
- **Reboot Switch** You can restart the switch on this page. After restart, the switch will boot normally.
- **Backup Manager** You can back up the switch configuration.
- **Upgrade Manager** You can upgrade the switch configuration.
- **Dual Image** Select active or backup image on this Page.

4.8.1.1 Save Configuration

You can save the configuration of the switch on this page. The Factory Default screen in [Figure 4-8-1](#) appears.

Save Configuration	
Source File	<input checked="" type="radio"/> Running configuration <input type="radio"/> Startup configuration <input type="radio"/> Backup configuration
Destination File	<input checked="" type="radio"/> Startup configuration <input type="radio"/> Backup configuration

Apply

Figure 4-8-1: Save Configuration Page Screenshot

Buttons

: Click to apply changes.

4.8.1.2 Factory Default

You can reset the configuration default of the switch on this page. Only the IP configuration is retained. The new configuration is available immediately, which means that no restart is necessary. The Factory Default screen in [Figure 4-8-2](#) appears and clicks to reset the configuration to Factory Defaults.

Figure 4-8-2: Factory Default Page Screenshot

After the "**Restore**" button is pressed and rebooted, the system will load the default IP settings as follows:

- Default IP address: **192.168.0.100**
- Subnet mask: **255.255.255.0**
- Default Gateway: **192.168.0.254**
- The other setting value is back to disable or none.

To reset the Managed Switch to the Factory default setting, you can also press the hardware reset button at the front panel about 10 seconds. After the device be rebooted. You can login the management WEB interface within the same subnet of 192.168.0.xx.

4.8.1.3 Reboot Switch

The **Reboot** page enables the device to be rebooted from a remote location. Once the Reboot button is pressed, user has to re-login the Web interface for about 60 seconds. The Reboot Switch screen in [Figure 4-8-3](#) appears and clicks to reboot the system.

Figure 4-8-3: Reboot Switch Page Screenshot

4.8.1.4 Backup Manager

This function allows backup of the current image or configuration of the Managed Switch to the local management station. The Backup Manager screen in [Figure 4-8-4](#) appears.

Backup Manager	
Backup Method	HTTP ▼
Backup Type	<input checked="" type="radio"/> Image <input type="radio"/> Running Configuration <input type="radio"/> Startup Configuration <input type="radio"/> Backup Configuration <input type="radio"/> Flash log <input type="radio"/> Buffered log
Image	<input type="radio"/> FW-GS-4210-24P2S_v3.305b211007.bix (Backup) <input checked="" type="radio"/> FW-GS-4210-24P2S_v3.305b211007.bix (Active)

Backup

Figure 4-8-4: Backup Manager Page Screenshot

The page includes the following fields:

Object	Description
• Backup Method	Select backup method for this drop down list.
• Backup Type	Select backup type.
• Image	Select active or backup image.

Buttons

Backup: Click to back up image, configuration or log.

4.8.1.5 Upgrade Manager

This function allows reloading of the current image or configuration of the Managed Switch to the local management station.

The Upgrade Manager screen in [Figure 4-8-5](#) appears.

Upgrade Manager	
Upgrade Method	HTTP
Upgrade Type	<input checked="" type="radio"/> Image <input type="radio"/> Startup Configuration <input type="radio"/> Backup Configuration <input type="radio"/> Running Configuration
Image	<input type="radio"/> (Backup) <input checked="" type="radio"/> (Active)
Browse file	<input type="button" value="Choose File"/> No file chosen

Figure 4-8-5: Upgrade Manager Page Screenshot

The page includes the following fields:

Object	Description
• Upgrade Method	Select upgrade method for this drop down list.
• Upgrade Type	Select upgrade type.
• Image	Select active or backup image.
• Browse File	Click the  button of the Main page; the system would pop up the file selection menu to choose firmware.

Buttons

: Click to upgrade image or configuration.

4.8.1.6 Dual Image

This page provides information about the active and backup firmware images in the device, and allows you to revert to the backup image. The web page displays two tables with information about the active and backup firmware images. The Dual Image Configuration and Information screens in [Figure 4-8-6](#) & [Figure 4-8-7](#) appear.

Figure 4-8-6: Dual Image Configuration Page Screenshot

The page includes the following fields:

Object	Description
• Active Image	Select the active or backup image

Buttons

Apply: Click to apply active image.

FW-GS-4210-24P2S_v3.305b211007.bix		Backup

• Flash Partition	Display the current flash partition.
• Image Name	Display the current image name.
• Image Size	Display the current image size.
• Created Time	Display the created time.

4.8.2 Diagnostics

This section provide the Physical layer and IP layer network diagnostics tools for troubleshoot. The diagnostic tools are designed for network manager to help them quickly diagnose problems between point to point and better service customers.

Use the Diagnostics menu items to display and configure basic administrative details of the Managed Switch. The ping and IPv6 ping allow you to issue ICMP PING packets to troubleshoot IP connectivity issues. The Managed Switch transmits ICMP packets, and the sequence number and roundtrip time are displayed upon reception of a reply. Under System the following topics are provided to configure and view the system information: This section has the following items:

- **Cable Diagnostics** You can run the cable diagnostics of the switch on this page.
- **Ping Test** You can run the IPv4 IP address ping test of the switch on this page.
- **IPv6 Ping Test** You can run the IPv6 IP address ping test of the switch on this page.

4.8.2.1 Cable Diagnostics

The Cable Diagnostics performs tests on copper cables. These functions have the ability to identify the cable length and operating conditions, and to isolate a variety of common faults that can occur on the Cat5 twisted-pair cabling. There might be two statuses as follow:

- If the link is established on the twisted-pair interface in 1000BASE-T mode, the Cable Diagnostics can run without disruption of the link or of any data transfer.
- If the link is established in 100BASE-TX or 10BASE-T, the Cable Diagnostics cause the link to drop while the diagnostics are running.

After the diagnostics are finished, the link is reestablished. And the following functions are available.

- Coupling between cable pairs.
- Cable pair termination
- Cable Length

Cable Diagnostics is only accurate for cables of length from 15 to 100 meters.

The Copper test and test result screens in [Figure 4-8-8](#) & [Figure 4-8-9](#) appear.

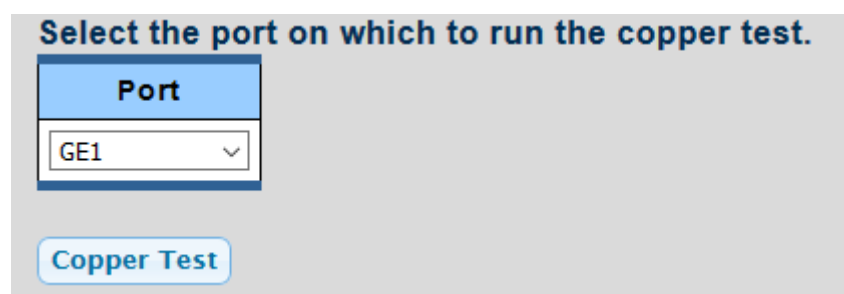

Figure 4-8-8: Copper Test Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Port 	Select port for this drop down list.

Buttons

Copper Test: Click to run the diagnostics

Test Results									
Port	Channel A	Cable Length A	Channel B	Cable Length B	Channel C	Cable Length C	Channel D	Cable Length D	Result
GE28	NORMAL	6.00 (m)	NORMAL	6.00 (m)	NORMAL	6.00 (m)	NORMAL	6.00 (m)	PASS

Figure 4-8-9: Test Results Page Screenshot

The page includes the following fields:

Object	Description
<ul style="list-style-type: none"> Port 	The port where you are requesting Cable Diagnostics.
<ul style="list-style-type: none"> Channel A~D 	Display the current channel status.
<ul style="list-style-type: none"> Cable Length A~D 	Display the current cable length.
<ul style="list-style-type: none"> Result 	Display the test result.

4.8.2.2 Ping Test

This page allows you to issue ICMP PING packets to troubleshoot IP connectivity issues. After you press **"Apply"**, ICMP packets are transmitted, and the sequence number and roundtrip time are displayed upon reception of a reply. The page refreshes automatically until responses to all packets are received, or until a timeout occurs. The ICMP Ping screen in [Figure 4-8-10](#) appears.

Ping Test Setting	
IP Address	<input type="text"/> (x.x.x.x or hostname)
Count	<input type="text" value="4"/> (1 - 5 Default : 4)
Interval (in sec)	<input type="text" value="1"/> (1 - 5 Default : 1)
Size (in bytes)	<input type="text" value="64"/> (8 - 5120 Default : 64)
Ping Results	<div style="border: 1px solid #ccc; height: 200px; width: 100%;"></div>

Figure 4-8-10: ICMP Ping Page Screenshot

The page includes the following fields:

Object	Description
• IP Address	The destination IP Address.
• Count	Number of echo requests to send.
• Interval (in sec)	Send interval for each ICMP packet.
• Size (in bytes)	The payload size of the ICMP packet. Values range from 8bytes to 5120bytes.
• Ping Results	Display the current ping result.

Buttons

: Click to transmit ICMP packets.

Note

Be sure the target IP Address is within the same network subnet of the switch, or you have to set up the correct gateway IP address.

4.8.2.3 IPv6 Ping Test

This page allows you to issue ICMPv6 PING packets to troubleshoot IPv6 connectivity issues.

After you press **"Apply"**, 5 ICMPv6 packets are transmitted, and the sequence number and roundtrip time are displayed upon reception of a reply. The page refreshes automatically until responses to all packets are received, or until a timeout occurs. The ICMPv6 Ping screen in [Figure 4-8-11](#) appears.

Ping Test Setting

IPv6 Address	<input type="text" value=""/> (XX:XX::XX:XX)
Count	<input type="text" value="4"/> (1 - 5 Default : 4)
Interval (in sec)	<input type="text" value="1"/> (1 - 5 Default : 1)
Size (in bytes)	<input type="text" value="64"/> (8 - 5120 Default : 64)
Ping Results	<div style="background-color: #e0e0e0; height: 200px;"></div>

Apply

Figure 4-8-11: ICMPv6 Ping Page Screenshot

The page includes the following fields:

Object	Description
• IPv6 Address	The destination IPv6 Address.
• Count	Number of echo requests to send.
• Interval (in sec)	Send interval for each ICMP packet.
• Size (in bytes)	The payload size of the ICMP packet. Values range from 8bytes to 5120bytes.
• Ping Results	Display the current ping result.

Buttons

Apply: Click to transmit ICMPv6 packets

5. COMMAND LINE INTERFACE

5.1 Accessing the CLI

When accessing the management interface for the switch over a direct connection to the server's console port, or via a Telnet connection, the switch can be managed by entering command keywords and parameters at the prompt. Using the switch's command-line interface (CLI) is very similar to entering commands on a UNIX system.

This chapter describes how to use the Command Line Interface (CLI).

The following console screen based on the GS-4210-24P2S is the same as those of other GS-4210 series.

Logon to the Console

Once the terminal is connected to the device, power on the Managed Switch and the terminal will **run self testing procedures**.

Then, the following message asks to login user name and password. The factory default user name and password are shown as follows and the login screen in [Figure 5-1](#) appears.

```
Username: admin
Password: admin
```

1. On "**Username**" & "**Password**" prompt, enter "**admin**".
2. The user can now enter commands to manage the Managed Switch. For a detailed description of the commands, please refer to the following chapters.

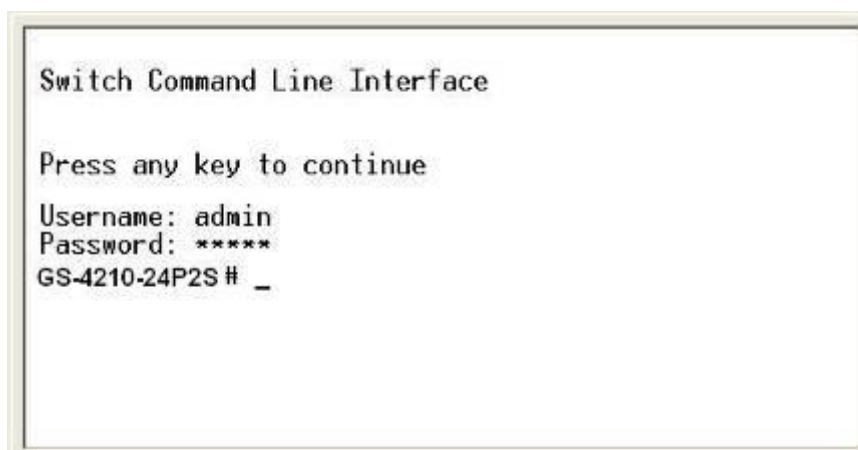

Figure 5-1: Managed Switch Console Login Screen

1. For security reason, please change and memorize the new password after this first setup.
2. Only accept command in lowercase letter under console interface.

Configure IP address

The Managed Switch is shipped with default IP address as follows:

IP Address: **192.168.0.100**
Subnet Mask: **255.255.255.0**

To check the current IP address or modify a new IP address for the Managed Switch, please use the procedures as follows:

■ Display of the current IP address

1. On "GS-4210-24P2S#" prompt, enter "show ip".
2. The screen displays the current IP address, Subnet Mask and Gateway shown in [Figure 5-2](#).

Figure 5-2: IP Information Screen

■ Configuration of the IP address

3. On "GS-4210-24P2S#" prompt, enter "configure".
4. On "GS-4210-24P2S (config)#" prompt, enter the following command and press <Enter> as shown in [Figure 5-3](#).

```

GS-4210-24P2S (config)# ip address 192.168.1.100 mask 255.255.255.0
GS-4210-24P2S (config)# ip default-gateway 192.168.1.254
  
```

The previous command would apply the following settings for the Managed Switch.

IP Address: 192.168.1.100
Subnet Mask: 255.255.255.0
Gateway: 192.168.1.254

```
GS-4210-24P2S# show ip
IP Address: 192.168.0.100
Subnet Netmask: 255.255.255.0
Default Gateway: 192.168.0.254
GS-4210-24P2S# configure
GS-4210-24P2S(config)# ip address 192.168.1.100 mask 255.255.255.0
GS-4210-24P2S(config)# ip default-gateway 192.168.1.254
GS-4210-24P2S(config)#
```

Figure 5-3: Setting IP Address Screen

5. Repeat Step 1 to check if the IP address is changed.

If the IP is successfully configured, the Managed Switch will apply the new IP address setting immediately. You can access the Web interface of Managed Switch through the new IP address.

If you do not familiar with console command or the related parameter, enter “?” anytime in console to get the help description.

5.2 Telnet Login

The Managed Switch also supports telnet for remote management. The Managed Switch asks for user name and password for remote login when using telnet, please use “admin” for username & password.

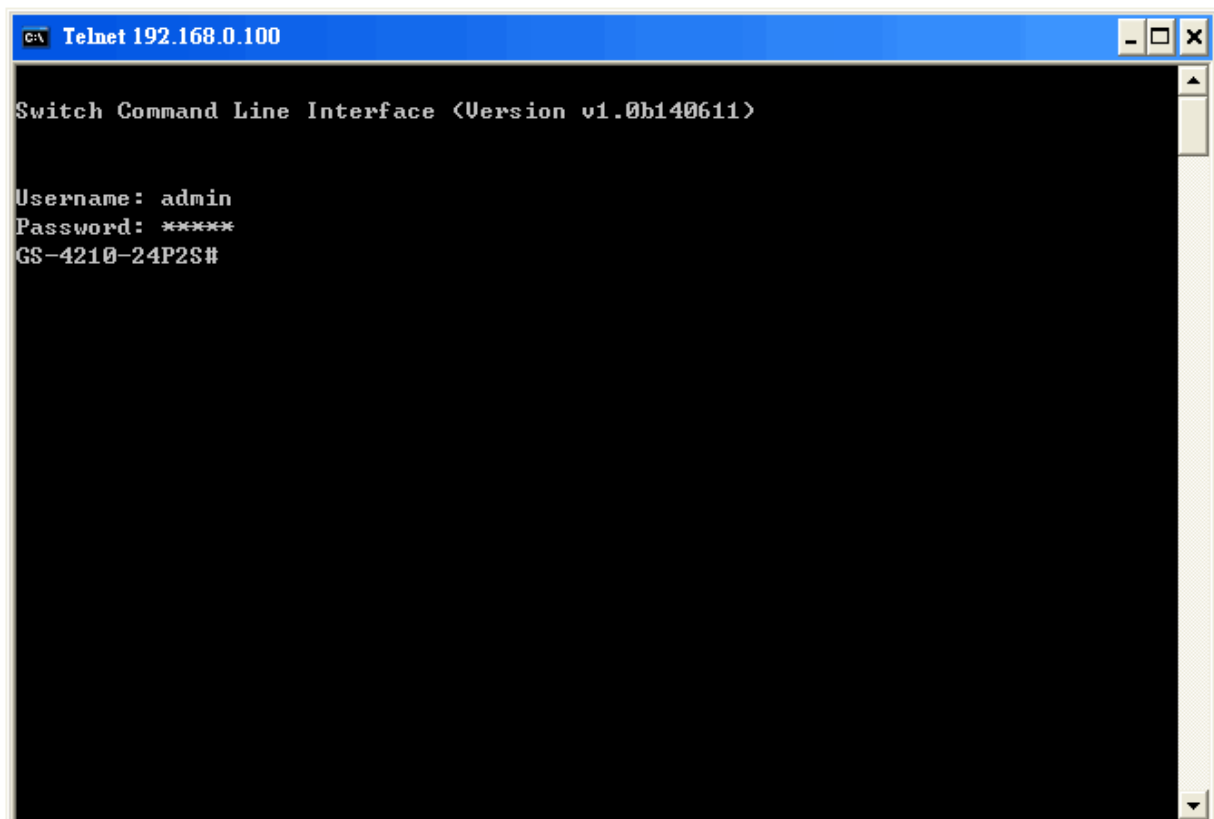

Figure 5-4: Telnet Login Screen

6. Command Line Mode

The CLI groups all the commands in appropriate modes according to the nature of the command. A sample of the CLI command modes are described below. Each of the command modes supports specific software commands.

The following screen based on GS-4210-24P2S will be the same as that of GS-4210-16T2S, GS-4210-24T2S, GS-4210-48T4S and GS-4210-16P2S.

Mode-based Command Hierarchy

The **Command Line Interface (CLI)** groups all the commands in appropriate modes by the nature of the commands. Examples of the CLI command modes are described below. Each of the command modes supports specific switch's commands.

The CLI Command Modes table captures the command modes, the prompts visible in that mode and the exit method from that mode.

Command Mode	Access Method	Prompt	Exit or Access Previous Mode
User Mode	This is the first level of access. Perform basic tasks and list system information.	GS-4210-24P2S>	Enter exit command
Privileged Mode	From the User Mode, enter the enable command.	GS-4210-24P2S #	To exit to the User Mode, enter exit .
Global Config Mode	From the Privileged Mode, enter the configuration command.	GS-4210-24P2S (Config)#	To exit to the Privileged Mode, enter the exit command.

Table 6-1: CLI Command Modes

The CLI is divided into various modes. The commands in one mode are not available until the operator switches to that particular mode. The commands available to the operator at any point in time depend upon the mode. Entering a question mark (?) at the CLI prompt, and displays a list of the available commands and descriptions of the commands.

The CLI provides the following modes:

User Mode

When the operator logs into the CLI, the User Mode is the initial mode. The User Mode contains a limited set of commands.

The command prompt shown at this level is:

Command Prompt: GS-4210-24P2S >

Privileged Mode

To have access to the full suite of commands, the operator must enter the Privileged Mode. The Privileged Mode requires password authentication. From Privileged Mode, the operator can issue any Exec command to enter the Global Configuration mode. The command prompt shown at this level is:

Command Prompt: GS-4210-24P2S #

Global Config Mode

This mode permits the operator to make modifications to the running configuration. General setup commands are grouped in this mode. From the Global Configuration mode, the operator can enter the Interface Configuration mode. The command prompt at this level is:

Command Prompt: GS-4210-24P2S (Config)#

From the Global Config mode, the operator may enter the following configuration modes:

6.1 User Mode Commands

6.1.1 enable command

Description:

Turn on privileged mode command

Syntax:

enable

Example:

```
GS-4210-24P2S > enable
```

```
Password:
```

```
GS-4210-24P2S #
```

6.1.2 exit command

Description:

Exit current mode and down to previous mode

Syntax:

exit

Example:

```
GS-4210-24P2S # exit
GS-4210-24P2S >
```

6.1.3 ping command

Description:

Send ICMP ECHO_REQUEST to network hosts

Syntax:

ping HOSTNAME (Host name)

Example:

```
GS-4210-24P2S > ping 192.168.0.100
PING 192.168.0.100 (192.168.0.100): 56 data bytes
64 bytes from 192.168.0.100: icmp_seq=0 ttl=64 time=0.0 ms
64 bytes from 192.168.0.100: icmp_seq=1 ttl=64 time=0.0 ms
64 bytes from 192.168.0.100: icmp_seq=2 ttl=64 time=0.0 ms
64 bytes from 192.168.0.100: icmp_seq=3 ttl=64 time=0.0 ms
--- 192.168.0.100 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max = 0.0/0.0/0.0 ms
GS-4210-24P2S >
```

6.1.4 Show Command

show arp

Description:

Show the IP ARP translation table

Syntax:

show arp

Example:

```
GS-4210-24P2S > show arp
Address           HWtype  HWaddress           Flags Mask           Iface
192.168.0.100     ether   A8:F7:E0:5C:54:BF   C                    eth0
GS-4210-24P2S >
```

show history

Description:

List the last several history commands

Syntax:

show history

Example:

```
GS-4210-24P2S > show history
```

show info

Description:

Show basic information

Syntax:

show info

Example:

```
GS-4210-24P2S > show info
```

show ip

Description:

Show the IP Address, Subnet Mask, Default Gateway

Syntax:

show ip

Example:

```
GS-4210-24P2S > show ip
IP Address: 192.168.0.100
Subnet Netmask: 255.255.255.0
Default Gateway: 192.168.0.254
GS-4210-24P2S >
```

show privilege

Description:

Show the local user privilege level

Syntax:

show privilege

Example:

```
GS-4210-24P2S > show privilege
Current CLI Username:  admin
Current CLI Privilege: 15
GS-4210-24P2S >
```

show version

Description:

Show the system hardware and software status

Syntax:

show version

Example:

```
GS-4210-24P2S > show version
Loader Version   : 1.0.0.48161
Loader Date      : Feb 22 2019 - 15:04:11
Firmware Version : 3.305b211007
Firmware Date    : Oct 07 2021 - 16:41:44
GS-4210-24P2S >
```

6.1.5 terminal command

Description:

Terminal configuration

Syntax:

terminal length <0-24> Length value. 0 means no limit

Example:

```
GS-4210-24P2S > terminal length 0
```

6.2 Privileged Mode Commands

6.2.1 clear command

clear arp

Description:

Clear entries in the ARP cache

Syntax:

clear arp A.B.C.D (IP address to clear)

clear arp (the entire ARP cache is cleared)

Example:

```
GS-4210-24P2S # clear arp 192.168.0.100
GS-4210-24P2S #
GS-4210-24P2S # clear arp
GS-4210-24P2S #
```

clear gvrp

Description:

Clear the GVRP configuration

Syntax:

clear GVRP error-statistics (GVRP Error Statistics information)

clear GVRP statistics (GVRP Statistics information)

Example:

```
GS-4210-24P2S # clear gvrp error-statistics
GS-4210-24P2S # clear gvrp statistics
GS-4210-24P2S #
```

clear interfaces

Description:

Clear the Interface status and configuration

Syntax:

clear interface LAG <1-8> counters

clear interfaces GigabitEthernet <1-26> counters

Example:

```
GS-4210-24P2S # clear interfaces lag 1 counters
GS-4210-24P2S # clear interfaces GigabitEthernet 1 counters
GS-4210-24P2S #
```

clear ip arp

Description:

Clear the IP configuration

Syntax:

clear ip arp inspection interfaces LAG <1-8> statistics

clear ip arp inspection interfaces GigabitEthernet <1-26> statistics

Example:

```
GS-4210-24P2S # clear ip arp inspection interfaces lag 1 statistics
GS-4210-24P2S # clear ip arp inspection interfaces GigabitEthernet 1 statistics
GS-4210-24P2S #
```

clear ip dhcp

Description:

Clear the DHCP configuration

Syntax:

clear ip dhcp snooping database statistics

clear ip dhcp snooping interfaces LAG <1-8> statistics

clear ip dhcp snooping interfaces GigabitEthernet <1-26> statistics

Example:

```
GS-4210-24P2S # clear ip dhcp snooping database statistics
GS-4210-24P2S # clear ip dhcp snooping interfaces lag 1 statistics
GS-4210-24P2S # clear ip dhcp snooping interface GigabitEthernet 1 statistics
GS-4210-24P2S #
```

clear ip igmp

Description:

Clear the IGMP configuration

Syntax:

clear ip igmp snooping groups dynamic/static

clear ip igmp snooping statistics

clear ip dhcp snooping vlan x static-mac xx:xx:xx:xx:xx:xx

Example:

```
GS-4210-24P2S # clear ip igmp snooping groups dynamic
GS-4210-24P2S # clear ip igmp snooping groups static
GS-4210-24P2S # clear ip igmp snooping statistics
GS-4210-24P2S # clear ip igmp snooping vlan 1 static-mac 00:30-4F:00:00:01
GS-4210-24P2S #
```

clear ipv6

Description:

Clear the ipv6 information

Syntax:

clear ipv6 mld snooping groups dynamic/static

clear ipv6 mld snooping statistics

clear ipv6 mld snooping vlan x static-mac xx:xx:xx:xx:xx:xx

Example:

```
GS-4210-24P2S # clear ipv6 mld snooping groups dynamic
GS-4210-24P2S # clear ipv6 mld snooping groups static
GS-4210-24P2S # clear ipv6 mld snooping statistics
GS-4210-24P2S # clear ipv6 mld snooping vlan 1 static-mac 00:30:4F:00:00:01
GS-4210-24P2S #
```

clear lacp

Description:

Clear LACP Configuration

Syntax:

<1-8> LAG number

counters Traffic information

Example:

```
GS-4210-24P2S # clear lacp 1 counters
GS-4210-24P2S #
```

clear line

Description:

Clear identify a specific line for configuration

Syntax:

clear line ssh/telnet

Example:

```
GS-4210-24P2S # clear line ssh
GS-4210-24P2S # clear line telnet
GS-4210-24P2S #
```

clear lldp

Description:

Clear lldp configuration

Syntax:

clear line lldp statistics

Example:

```
GS-4210-24P2S # clear lldp statistics
GS-4210-24P2S #
```

clear logging

Description:

Clear log configuration

Syntax:

clear logging buffered/flash

Example:

```
GS-4210-24P2S # clear logging buffered
GS-4210-24P2S # clear logging flash
GS-4210-24P2S #
```

clear mac

Description:

Clear MAC configuration

Syntax:

clear mac address-table dynamic interface lag x
clear mac address-table dynamic interface GigabitEthernet x
clear mac address-table dynamic vlan x

Example:

```
GS-4210-24P2S # clear mac address-table dynamic interfaces lag 1
GS-4210-24P2S # clear mac address-table dynamic interfaces GigabitEthernet 1
GS-4210-24P2S # clear mac address-table dynamic vlan 1
GS-4210-24P2S #
```

clear rmon

Description:

Clear RMON information

Syntax:

clear rmon interfaces lag x statistics

clear rmon interfaces GigabitEthernet x statistics

Example:

```
GS-4210-24P2S # clear rmon interfaces lag 1 statistics
GS-4210-24P2S # clear rmon interfaces GigabitEthernet 1 statistics
GS-4210-24P2S #
```

6.2.2 clock command

Description:

Manage the system clock

Syntax:

clock set HH:MM:SS:Month: Date: Year

Example:

```
GS-4210-24P2S # clock set 13:36:00 jul 3 2014
13:36:00 DFL(UTC+8) Jul 03 2014
GS-4210-24P2S #
```

6.2.3 configure command

Description:

Enter Global Config mode

Syntax:

configure

Example:

```
GS-4210-24P2S # configure
GS-4210-24P2S (config)#
```

6.2.4 copy command

Description:

Copy from one file to another

Syntax:

copy backup-config/flash:///running-config/startup-config/tftp:// running-config/startup-config/tftp://

Example:

```
GS-4210-24P2S # copy running-config startup-config
Success
GS-4210-24P2S #
```

6.2.5 delete command

Description:

Delete a file from the flash file system

Syntax:

delete backup-config/flash:///startup-config/system image x

Example:

```
GS-4210-24P2S # delete backup-config
GS-4210-24P2S # delete flash://
GS-4210-24P2S # delete startup-config
GS-4210-24P2S # delete system image 0
GS-4210-24P2S #
```

6.2.6 disable command

Description:

Turn off privileged mode command

Syntax:

disable

Example:

```
GS-4210-24P2S # disable
GS-4210-24P2S >
```

6.2.7 end command

Description:

End current mode and change to enable mode

Syntax:

end

Example:

```
GS-4210-24P2S (config)# end
GS-4210-24P2S #
```

6.2.8 exit command

Description:

Exit current mode and down to previous mode

Syntax:

exit

Example:

```
GS-4210-24P2S # exit
GS-4210-24P2S >
```

6.2.9 ping command

Description:

Send ICMP ECHO_REQUEST to network hosts

Syntax:

ping HOSTNAME (Host name)

Example:

```
GS-4210-24P2S > ping 192.168.0.100
PING 192.168.0.100 (192.168.0.100): 56 data bytes
64 bytes from 192.168.0.100: icmp_seq=0 ttl=64 time=0.0 ms
64 bytes from 192.168.0.100: icmp_seq=1 ttl=64 time=0.0 ms
64 bytes from 192.168.0.100: icmp_seq=2 ttl=64 time=0.0 ms
64 bytes from 192.168.0.100: icmp_seq=3 ttl=64 time=0.0 ms
--- 192.168.0.100 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max = 0.0/0.0/0.0 ms
GS-4210-24P2S >
```

6.2.10 reboot command

Description:

Halt and perform a cold restart

Syntax:

reboot

Example:

```
GS-4210-24P2S # reboot
*Jul 03 14:22:09: %System-4: System reboot
```

6.2.11 renew command

Description:

Renew IP configuration

Syntax:

renew ip dhcp snooping database

Example:

```
GS-4210-24P2S # renew ip dhcp snooping database
GS-4210-24P2S #
```

6.2.12 restore-defaults command

Description:

Restore to default

Syntax:

restore-defaults

Example:

```
GS-4210-24P2S # restore-defaults
Restore Default Success. Do you want to reboot now? (y/n)y
Rebooting now...
*Jan 01 08:16:00: %System-4: System reboot
```

6.2.13 save command

Description:

Save running configuration to flash

Syntax:

save

Example:

```
GS-4210-24P2S # save
Success
GS-4210-24P2S #
```

6.2.14 show command

Description:

Show running system information

Syntax:

show specific item

Example:

```
GS-4210-24P2S # show version
Loader Version   : 1.0.0.48161
Loader Date      : Jan 13 2020 - 15:18:03
Firmware Version : 2.305b200122
Firmware Date    : Jan 22 2020 - 14:49:27
GS-4210-24P2S #
```

6.2.15 ssl command

Description:

Setup SSL host keys

Syntax:

ssl

Example:

```
GS-4210-24P2S # ssl
Generating a 1024 bit RSA private key
.....++++++
writing new private key to '/mnt/ssh/ssl_key.pem'
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
If you enter '.', the field will be left blank.
Country Name (2 letter code) [AU]:2
string is too short, it needs to be at least 2 bytes long
Country Name (2 letter code) [AU]:TW
State or Province Name (full name) [Some-State]:TW
Locality Name (eg, city) []:Taipei
Organization Name (eg, company) [Internet Widgits Pty Ltd]:PLANET
Organizational Unit Name (eg, section) []:GS-4210-24P2S
Common Name (e.g. server FQDN or YOUR name) []:Marc
Email Address []:marcl@planet.com.tw
GS-4210-24P2S #
```

6.2.16 terminal command

Description:

Terminal configuration

Syntax:

terminal length<0-24> Length value. 0 means no limit

Example:

```
GS-4210-24P2S # terminal length 0
GS-4210-24P2S #
```

6.3 Global Config Mode Commands

6.3.1 aaa Command

Description:

AAA (Authentication, Authorization, Accounting)

Syntax:

aaa accounting commands/exec/system/update

aaa authentication enable/login

6.3.2 boot Command

Description:

Booting Operations

Syntax:

boot host auto-config

boot system image0/1

6.3.3 clock Command

Description:

Manage the system clock

Syntax:

clock source local/sntp

clock summer-time

clock timezone

6.3.4 dos Command

Description:

DoS information

Syntax:

dos

daeqsa-deny	Destination MAC equals to source MAC
icmp-frag-pkts-deny	Fragmented ICMP packets
icmp-ping-max-length	DoS information
icmpv4-ping-max-check	Check ICMPv4 ping maximum packets size
icmpv6-ping-max-check	Check ICMPv6 ping maximum packets size
ipv6-min-frag-size-check	Check minimum size of IPv6 fragments

ipv6-min-frag-size-length	DoS information
land-deny	Source IP equals to destination IP
nullscan-deny	NULL Scan Attacks
pod-deny	Ping of Death Attacks
smurf-deny	Smurf Attacks
smurf-netmask	DoS information
syn-sportl1024-deny	SYN packets with sport less than 1024
synfin-deny	SYN and FIN bits set in the packet
synrst-deny	SYNC and RST bits set in the packet
tcp-frag-off-min-check	TCP fragment packet with offset equals to one
tcpblat-deny	Source TCP port equals to destination TCP port
tcphdr-min-check	Check minimum TCP header
tcphdr-min-length	DoS information
udpblat-deny	Source UDP port equals to destination UDP port
xma-deny	Xmascan: sequence number is zero and the FIN, URG and PSH bits are set

6.3.5 dot1x Command

Description:

802.1x configuration

Syntax:

dot1x guest-vlan<1-4094> VLAN ID (e.g. 100)

6.3.6 do Command

Description:

To run exec commands in current mode

Syntax:

do SEQUENCE (Exec Command)

6.3.7 enable Command

Description:

Local Enable Password

Syntax:

enable password/privilege/secret

6.3.8 end Command

Description:

End current mode and change to enable mode

Syntax:

end

6.3.9 erps Command

Description:

ERPS

Syntax:

<1-64> Ring ID <1~64>

6.3.10 errdisable Command

Description:

Error Disable

Syntax:

errdisable recovery cause/interval

6.3.11 exit Command

Description:

Exit current mode and down to previous mode

Syntax:

Exit

6.3.12 gvrp Command

Description:

GVRP configuration

Syntax:

gvrp time join/leave/leaveall

6.3.13 hostname Command

Description:

Set system's network name

Syntax:

hostname WORD (this system's network name)

6.3.14 interface Command

Description:

Select an interface to configure

Syntax:

Interface GigabitEthernet/LAG/range

6.3.15 ip Command

Description:

IP configuration

Syntax:

ip

acl This command creates an ACL, which perform classification on layer 3 fields and enters ip-access configuration mode.

address	IPv4 Address
arp	ARP configuration
default-gateway	Set default gateway IP address
dhcp	DHCP configuration
dns	Domain Name Server
http	HTTP server configuration
https	HTTPS server configuration
igmp	IGMP Configuration
source	IP Source Guard Configuration
ssh	SSH (Secure Shell) configuration
telnet	Telnet daemon configuration

6.3.16 ipv6 Command

Description:

IPv6 configuration

Syntax:

ipv6

acl This command creates an ACL, which perform classification on layer 3 fields and enters to ipv6-access configuration mode.

address	Set IPv6 address and prefix
autoconfig	Enable Ipv6 auto-configuration
default-gateway	Set IPv6 gateway
dhcp	Set IPv6 DHCP Client
mld	MLD Configuration

6.3.17 jumbo-frame Command

Description:

Jumbo Frame configuration

Syntax:

jumbo-frame <64-9216> (Maximum frame size)

6.3.18 lacp Command

Description:

LACP Configuration

Syntax:

lacp system-priority <1-65535> (LACP system priority)

6.3.19 lag Command

Description:

Link Aggregation Group Configuration

Syntax:

lag load-balance src-dst-mac/src-dst-mac-ip

6.3.20 line Command

Description:

To identify a specific line for configuration

Syntax:

line console/ssh/telnet

6.3.21 lldp Command

Description:

LLDP Configuration

Syntax:

lldp	
holdtime-multiplier	Configure LLDP holdtime multiplier
lldpdu	Configure LLDP PDU handling when LLDP is disabled
med	LLDP MED configuration
reinit-delay	Configure LLDP reinitialization delay
tx-delay	Configure LLDP TX delay
tx-interval	Configure LLDP transmission interval

6.3.22 logging Command

Description:

Log Configuration

Syntax:

logging	
buffered	RAM
flash	Flash
host	Remote syslog host

6.3.23 mac Command

Description:

MAC Configuration

Syntax:

mac	
acl	This command enters the extended MAC ACL configuration in order to create layer 2 extended ACL.
address-table	MAC address table configuration

6.3.24 management Command

Description:

Management IP configuration

Syntax:

access-class Use this command to choose the active access-list.

access-list Use this command to configure a management access list.

6.3.25 management-vlan Command

Description:

Management VLAN configuration

Syntax:

management-vlan vlan <1-4094> VLAN ID (e.g. 100)

6.3.26 mirror Command

Description:

Mirror configuration

Syntax:

mirror session <1-4> Session ID (e.g. 1-4)configuraton destination/source interface/GigabitEthernet <1-26> GigabitEthernet
device number

6.3.27 nms Command

Description:

Enable and set the switch's NMS agent operation mode configuration

Syntax:

operation-mode Set the switch's NMS agent operation mode configuration

6.3.28 no Command

Description:

Negate command

Syntax:

No

6.3.29 poe Command

Description:

This command provide PoE configuration

Syntax:

poe	
admin-mode	Configure System PoE Admin mode information
command	command
legacy	PoE legacy mode
limit-mode	Configure System PoE power limit mode information
mode	Select the port poe mode function (endsapn/midspan/upoe/bt)
pdalive-add	Add PoE PD alive check
port	Enable/Disable/Schedule the port PoE injects function
power-limit	Enable per port power output limit
power_budget	Configure System PoE power budget information
priority	Set PoE priority for the power supply management
schedule-add	Add PoE schedule list
schedule-delete	Delete PoE schedule list
schedule-profile	Select PoE schedule profile
temperature_threshold	Configure System PoE temperature threshold information

6.3.30 port-security Command

Description:

Port security Configuration

Syntax:

port-security

6.3.31 qos Command

Description:

Enable/Disable QoS on the device and enter the QoS mode (advance/basic)

Syntax:

qos	
advanced	Enable/Disable QoS on the device and enter the QoS mode (advance/basic).
advanced-mode	Set the trust mode when the default action is ports-trusted in advanced mode.
aggregate-policer	Configure a policer that can be applied to multiple classes within the same policy map. Use the no form of the command to remove policer.
basic	Set system QoS advance mode.
map	Configure the QoS maps.
queue	Queue configuration
trust	Configure the global trust mode . Use the no form to return untrusted state.

6.3.32 radius Command

Description:

RADIUS server information

Syntax:

radius default-config/host

6.3.33 rmon Command

Description:

RMON information

Syntax:

rmon alarm/event/history

6.3.34 Snmp Command

Description:

SNMP information

Syntax:

snmp

community Set community or security name string

engineid SNMP engine id setting

group Set access group string

host Trap or inform host

trap Snmp class trap setting

user Set user Settings

view Set view string

6.3.35 sntp Command

Description:

Simple Network Time Protocol

Syntax:

sntp host

6.3.36 spanning-tree Command

Description:

Spanning-tree configuration

Syntax:

Spanning-tree

bpdu	action for bpdu packet
forward-delay	Sets the forward-delay parameter
hello-time	Sets the hello-time parameter
max-hops	Sets the max-hops parameter
maximum-age	Changes the interval between messages the spanning tree receives from the root switch
mode	Spanning tree protocol type
mst	Multiple spanning tree configuration
pathcost	Spanning tree path-cost method
priority	Sets the priority for specified instance
tx-hold-count	Set spanning-tree tx hold count, in seconds

6.3.37 storm-control Command

Description:

Storm control configuration

Syntax:

Storm-control

ifg Interframe configuration

unit Unit configuration

6.3.38 system Command

Description:

System information

Syntax:

contact Set host contact

location Set host location

name Set host name

6.3.39 tacacs Command

Description:

TACACS+ server information

Syntax:

tacacs

default-config TACACS+ server default parameters

host TACACS+ server host

6.3.40 username Command

Description:

Local User Configuration

Syntax:

username USERNAME Local user name

nopassword No password for this user

password Use clear text password

privilege Local user privilege level

secret Use encrypted password

6.3.41 vlan Command

Description:

VLAN Configuration

Syntax:

vlan

VLAN-LIST VLAN List (e.g. 3,6-8): The range of VLAN ID is 1 to 4094

protocol-vlan 802.1v protocol VLAN configuration

6.3.42 voice-vlan Command

Description:

Voice VLAN Configuration

Syntax:

voice vlan <1-4094> (Specifies the Voice VLAN Identifier)

7. SWITCH OPERATION

7.1 Address Table

The Switch is implemented with an address table. This address table composed of many entries. Each entry is used to store the address information of some node in network, including MAC address, port no, etc. This information comes from the learning process of Ethernet Switch.

7.2 Learning

When one packet comes in from any port, the Switch will record the source address, port no. And the other related information in address table. This information will be used to decide either forwarding or filtering for future packets.

7.3 Forwarding & Filtering

When one packet comes from some port of the Ethernet Switching, it will also check the destination address besides the source address learning. The Ethernet Switching will lookup the address-table for the destination address. If not found, this packet will be forwarded to all the other ports except the port, which this packet comes in. And these ports will transmit this packet to the network it connected. If found, and the destination address is located at different port from this packet comes in, the Ethernet Switching will forward this packet to the port where this destination address is located according to the information from address table. But, if the destination address is located at the same port with this packet comes in, then this packet will be filtered. Thereby increasing the network throughput and availability

7.4 Store-and-Forward

Store-and-Forward is one type of packet-forwarding techniques. A Store-and-Forward Ethernet Switching stores the incoming frame in an internal buffer, do the complete error checking before transmission. Therefore, no error packets occurrence, it is the best choice when a network needs efficiency and stability.

The Ethernet Switch scans the destination address from the packet-header, searches the routing table provided for the incoming port and forwards the packet, only if required. The fast forwarding makes the switch attractive for connecting servers directly to the network, thereby increasing throughput and availability. However, the switch is most commonly used to segment existence hubs, which nearly always improves overall performance. An Ethernet Switching can be easily configured in any Ethernet network environment to significantly boost bandwidth using conventional cabling and adapters.

Due to the learning function of the Ethernet switching, the source address and corresponding port number of each incoming and outgoing packet are stored in a routing table. This information is subsequently used to filter packets whose destination address is on the same segment as the source address. This confines network traffic to its respective domain and reduce the overall load on the network.

The Switch performs "Store and forward" therefore, no error packets occur. More reliably, it reduces the re-transmission rate. No packet loss will occur.

7.5 Auto-Negotiation

The STP ports on the Switch have built-in "Auto-negotiation". This technology automatically sets the best possible bandwidth when a connection is established with another network device (usually at Power On or Reset). This is done by detect the modes and speeds at the second of both device is connected and capable of, both 10BASE-T and 100BASE-TX devices can connect with the port in either Half- or Full-Duplex mode.

If attached device is:	100BASE-TX port will set to:
10Mbps, no auto-negotiation	10Mbps.
10Mbps, with auto-negotiation	10/20Mbps (10BASE-T/Full-Duplex)
100Mbps, no auto-negotiation	100Mbps
100Mbps, with auto-negotiation	100/200Mbps (100BASE-TX/Full-Duplex)

8. POWER OVER ETHERNET OVERVIEW

What is PoE?

The PoE is an abbreviation of Power over Ethernet; the PoE technology means a system to pass electrical power safely, along with data on Ethernet UTP cable. The IEEE standard for PoE technology requires Category 5 cable or higher for high power PoE levels, but can operate with category 3 cable for low power levels. Power is supplied in common mode over two or more of the differential pairs of wires found in the Ethernet cables and comes from a power supply within a PoE-enabled networking device such as an Ethernet switch or can be injected into a cable run with a mid-span power supply.

The original IEEE 802.3af-2003 PoE standard provides up to 15.4 W of DC power (minimum 44 V DC and 350mA) to each device. Only 12.95 W is assured to be available at the powered device as some power is dissipated in the cable.

The updated IEEE 802.3at-2009 PoE standard also known as PoE+ or PoE plus, provides up to 25.5 W of power. The 2009 standard prohibits a powered device from using all four pairs for power

The 802.3af/802.3at define two types of source equipment: Mid-Span and End-Span.

Mid-Span

Mid-Span device is placed between legacy switch and the powered device. Mid-Span is tap the unused wire pairs 4/5 and 7/8 to carry power, the other four is for data transmit.

End-Span

End-Span device is direct connecting with power device. End-Span could also tap the wire 1/2 and 3/6.

PoE System Architecture

The specification of PoE typically requires two devices: the **Powered Source Equipment (PSE)** and the **Powered Device (PD)**. The PSE is either an End-Span or a Mid-Span, while the PD is a PoE-enabled terminal, such as IP Phones, Wireless LAN, etc. Power can be delivered over data pairs or spare pairs of standard CAT-5 cabling.

Powered Source Equipment (PSE)

Power sourcing equipment (PSE) is a device such as a switch that provides (sources) power on the Ethernet cable. The maximum allowed continuous output power per cable in IEEE 802.3af is 15.40 W. A later specification, IEEE 802.3at, offers 25.50 W. When the device is a switch, it is commonly called an End-span (although IEEE 802.3af refers to it as endpoint). Otherwise, if it's an intermediary device between a non PoE capable switch and a PoE device, it's called a Mid-span. An external PoE injector is a Mid-span device.

Powered device

A powered device (PD) is a device powered by a PSE and thus consumes energy. Examples include wireless access points, IP Phones, and IP cameras. Many powered devices have an auxiliary power connector for an optional, external, power supply. Depending on the PD design, some, none, or all power can be supplied from the auxiliary port, with the auxiliary port sometimes acting as backup power in case of PoE supplied power failure.

How Power is Transferred Through the Cable

A standard CAT5 Ethernet cable has four twisted pairs, but only two of these are used for 10BASE-T and 100BASE-TX. The specification allows two options for using these cables for power, shown in Figure 1 and Figure 2:

The spare pairs are used. Figure 1 shows the pair on pins 4 and 5 connected together and forming the positive supply, and the pair on pins 7 and 8 connected and forming the negative supply. (In fact, a late change to the spec allows either polarity to be used).

Figure 8-1: Power Supplied over the Spare Pins

The data pairs are used. Since Ethernet pairs are transformer coupled at each end, it is possible to apply DC power to the center tap of the isolation transformer without upsetting the data transfer. In this mode of operation the pair on pins 3 and 6 and the pair on pins 1 and 2 can be of either polarity.

Figure 8-2: Power Supplied over the Data Pins

9. TROUBLESHOOTING

This chapter contains information to help you solve your issue. If the Managed Switch is not functioning properly, make sure the Managed Switch is set up according to instructions in this manual.

■ The Link LED is not lit

Solution:

Check the cable connection and remove duplex mode of the Managed Switch.

■ Some stations cannot talk to other stations located on the other port

Solution:

Please check the VLAN settings, trunk settings, or port enabled/disabled status.

■ Performance is bad

Solution:

Check the full duplex status of the Managed Switch. If the Managed Switch is set to full duplex and the partner is set to half duplex, then the performance will be poor. Please also check the in/out rate of the port.

■ Why the Switch doesn't connect to the network

Solution:

1. Check the LNK/ACT LED on the Managed Switch.
2. Try another port on the Managed Switch.
3. Make sure the cable is installed properly.
4. Make sure the cable is the right type.
5. Turn off the power. After a while, turn on power again.

■ 100BASE-TX port link LED is lit, but the traffic is irregular

Solution:

Check that the attached device is not set to dedicate full duplex. Some devices use a physical or software switch to change duplex modes. Auto-negotiation may not recognize this type of full-duplex setting.

■ Switch does not power up

Solution:

1. AC power cord not inserted or faulty
2. Check whether the AC power cord is inserted correctly
3. Replace the power cord if the cord is inserted correctly, check that the AC power source is working by connecting a different device in place of the switch.
4. If that device works, refer to the next step.
5. If that device does not work, check the AC power

APPENDIX A

A.1 Switch's RJ45 Pin Assignments 1000Mbps, 1000BASE-T

Contact	MDI	MDI-X
1	BI_DA+	BI_DB+
2	BI_DA-	BI_DB-
3	BI_DB+	BI_DA+
4	BI_DC+	BI_DD+
5	BI_DC-	BI_DD-
6	BI_DB-	BI_DA-
7	BI_DD+	BI_DC+
8	BI_DD-	BI_DC-

Implicit implementation of the crossover function within a twisted-pair cable, or at a wiring panel, while not expressly forbidden, is beyond the scope of this standard.

A.2 10/100Mbps, 10/100BASE-TX

When connecting your 10/100Mbps Ethernet Switch to another switch, a bridge or a hub, a straight or crossover cable is necessary. Each port of the Switch supports auto-MDI/MDI-X detection. That means you can directly connect the Switch to any Ethernet devices without making a crossover cable. The following table and diagram show the standard RJ45 receptacle/connector and their pin assignments:

RJ45 Connector pin assignment		
Contact	MDI Media Dependent Interface	MDI-X Media Dependent Interface- Cross
1	Tx + (transmit)	Rx + (receive)
2	Tx - (transmit)	Rx - (receive)
3	Rx + (receive)	Tx + (transmit)
4, 5	Not used	
6	Rx - (receive)	Tx - (transmit)
7, 8	Not used	

The standard cable, RJ45 pin assignment

The standard RJ45 receptacle/connector

There are 8 wires on a standard UTP/STP cable and each wire is color-coded. The following shows the pin allocation and color of straight cable and crossover cable connection:

Straight-through Cable		SIDE 1	SIDE 2
1	2	1 = White/Orange	1 = White/Orange
2	3	2 = Orange	2 = Orange
3	4	3 = White/Green	3 = White/Green
4	5	4 = Blue	4 = Blue
5	6	5 = White/Blue	5 = White/Blue
6	7	6 = Green	6 = Green
7	8	7 = White/Brown	7 = White/Brown
8		8 = Brown	8 = Brown
Crossover Cable		SIDE 1	SIDE 2
1	2	1 = White/Orange	1 = White/Green
2	3	2 = Orange	2 = Green
3	4	3 = White/Green	3 = White/Orange
4	5	4 = Blue	4 = Blue
5	6	5 = White/Blue	5 = White/Blue
6	7	6 = Green	6 = Orange
7	8	7 = White/Brown	7 = White/Brown
8		8 = Brown	8 = Brown

Figure A-1: Straight-through and Crossover Cable

Please make sure your connected cables are with the same pin assignment and color as the above table before deploying the cables into your network.
